

Bovine Tuberculosis and Brucellosis Surveillance Results
Monthly Reports, Federal Fiscal Year (FY) 2016
November 1–30, 2015

New Information – Bovine Tuberculosis (TB)

No new TB cases or infected herds were detected in November.

Update of Previously Reported Information

- The appraisal was accepted and depopulation will begin in November, for the TB-infected Michigan dairy located in the Modified Accredited (MA) zone. This herd was detected during an annual whole herd test (WHT). This is the 61st TB-infected herd found in Michigan since 1998.
- Trace-outs from the Michigan beef herd located in the MA zone have been completed. There were no out-of-State traces associated with this herd. The herd was detected in May 2015 on an annual MA zone test and was depopulated in August 2015. This is the 62nd TB-infected herd found in Michigan since 1998.
- Michigan has received traces from the Texas feedlot and will begin working to determine the final disposition/location of the cattle.
- The first Texas dairy quarantined in October 2014 was appraised and planning is underway to begin depopulating this large dairy in December. Depopulation is expected to span several months. The initial estimated within herd prevalence was 5.9 percent.
- The second Texas dairy, quarantined in October 2014, is scheduled for a quarantine release test in December 2015. A total of three TB-infected cattle were associated with this herd, and no new infected cattle were detected during the fourth WHT.
- Sixty-six animals from the second removal test were necropsied in October, from the two Texas organic dairies and the associated Texas feedlot and heifer raiser. These premises were quarantined on April 8, 2015. A total of 39 lesioned cattle have been removed from the herd. The next WHT is scheduled for December.

Table 1. Bovine TB cases found through routine slaughter inspection, FY 2016.^a

Laboratory Status	New TB Cases November 1-30, 2015		Cumulative TB Cases November 1-30, 2015		
	Fed cattle	Adult cattle	Fed cattle	Adult cattle	Total
<i>M. bovis</i> cases, confirmed ^b	0	0	0	0	0
PCR pending	0	0	0	0	0
PCR negative, culture pending	0	0	0	0	0

^a Animals detected through routine slaughter inspection. Animals sent to slaughter with a 1-27 permit, "Permit for Movement of Restricted Animals" are not included.

^b Confirmed by PCR testing and/or culture.

Table 2. Livestock herds confirmed infected with bovine TB, FY 2016, including test-and-remove managed herds under quarantine and carried forward from previous fiscal years.

State	Federal Fiscal Year Detected	Method of Detection	Herd Type	Herd Management Plan	Closest Isolates by WGS (Number of SNP Differences) ^a	Wildlife Surveillance Planned?	Approximate Number of Animal Traces	States With Traced Cattle
MI ^b	2008	Surveillance	Cervid	Test and removal	MI	Ongoing	None	None
MI ^b	2008	Surveillance	Cervid	Test and removal	MI	Ongoing	None	None
TX	2015	Slaughter	Dairy	Depopulation	2004 TX (16), 2007 NM dairies (15), 2011 AZ roping steer from CHI (25)	Not indicated	None	None
TX	2015	Epidemiology	Dairy	Test and remove	Same as above	Not indicated	68	MI
MI	2015	Area Testing	Dairy	Depopulation	MI	Ongoing	368	Pending
TX	2015	Slaughter	Dairy ^c	Test and remove	1997 MX (8)	Not indicated	4,150	AZ, CA, CO, MO, MN, NM, TX, IN
MI	2015	Area Testing	Mixed	Depopulation	MI	Ongoing	None	None

^aWGS = whole genome sequencing, SNP = single nucleotide polymorphisms; () = number of SNP differences to the most recent common ancestor compared to other isolates in the National Veterinary Services Laboratories database.

^bTwo herds detected in previous fiscal years are included.

^cThis herd consists of two sister dairies and their associated common heifer raising/feedlot facility.

Brucellosis - Herds Remaining under Quarantine and Test-and-Remove Procedures or Awaiting Assurance Test Results

FY 2016

Wyoming

- Designated Surveillance Area (DSA) required testing of 164 adult Angus female cattle on a Park County premises on October 28, 2015, revealed one animal testing as reactor. The Wyoming Livestock Board issued a quarantine for this herd. There are two groups of animals comprising the total herd of 515 (including reactor cow): 165 head of cull cows on beet pasture and 350 head of retained breeding animals. The retained breeding animals were bled for brucellosis testing on November 6, 2015. All tested negative. The reactor animal was transported to a Wyoming lab under permit on November 10, 2015. The Wyoming State Veterinary Laboratory isolated *B. abortus* for tissues of the reactor cow on November 19, 2015, and this isolation was confirmed at National Veterinary Services Laboratories (NVSL). The main fence line contact herd has been bled and all 2000 animal were negative. An affected herd management plan is in place. The epidemiological investigation is proceeding with contact herds and traces being identified.

Updates: None

FY 2015

Montana

- Affected beef herd: On November 8, 2014, one reactor (an 8-year-old cow) was detected during testing of a group of 171 head in a Madison County commercial cow-calf beef herd. The herd had a DSA herd plan in place, as a portion of the herd grazes within the DSA. Whole herd testing of 2,338 head was completed December 10, 2015, and no additional seropositive animals were found. An Affected Herd Plan was put in place December 11th. All DSA-adjacent herds have been identified and have tested negative. Whole-herd test post-removal of the reactor was completed in January 2015 and all animals were negative. Post-calving whole herd test completed and all animals were brucellosis test negative. Quarantine has been released, and an assurance test is scheduled for this fall. Traces are pending. All non-DSA adjacent herds (27) have been identified and all tested negative.

Updates: Assurance testing began in October and is expected to continue through mid-December. All animals have tested negative so far. Traces are pending.

- Affected beef herd: On October 23, 2014, one reactor (a 3-year-old cow) was detected during testing of a group of 262 head in a Park/Carbon County commercial cow-calf beef herd. The reactor animal was part of a cohort that grazes seasonally in the DSA and was tested when leaving the DSA, per State law. The herd was placed under verbal quarantine October 25th. An Affected Herd Plan is in place. On October 31, 2014, the reactor's seropositive status was confirmed, and the milk samples submitted to NVSL for culture on November 12th were found negative for *Brucella* spp. On December 4th, tissues from the reactor animal were

collected and submitted to NVSL which reported the isolation of *B. abortus* biovar 1 on December 12, 2014. Whole-herd testing was completed December 18, 2014, and no additional seropositive animals were found. All the Park County adjacent herds have been tested and are negative. Whole-herd test post-removal of the reactor was completed in January 2015 and all animals were negative. Whole-herd test was completed March 11, 2015, and all animals were negative. Quarantine was lifted March 16, 2015. All Carbon County adjacent herds (4) have tested negative. Assurance test was completed in October 2015. All animals tested negative.

Updates: Traces are pending.

FY 2013

Montana

- Affected beef herd: On September 5, 2013, a single brucellosis reactor (2-year-old female) was detected on a DSA brucellosis pre-slaughter test of 42 head in Madison County. *B. abortus* biovar 1 was confirmed September 25, 2013. A herd brucellosis test (1116 head) detected one reactor and one suspect. The tissues were submitted, but no *B. abortus* isolation was made from either animal. DSA herd and affected herd plans are in place. Epidemiological work has determined the exposure occurred sometime in the spring of 2013. Nine adjacent herds have tested brucellosis negative. A whole-herd test conducted on January 8, 2014, was negative. No *Brucella* was isolated from tissues submitted from the suspect cow, detected on January test, or its fetus. There were no trace-in animals identified. Twenty of 22 trace-out epidemiological investigations, covering 467 cattle in nine States, have been completed. The post-calving whole-herd test in late March 2014 was negative and the quarantine for the herd was lifted in late March 2014. The fall assurance testing was completed in October 2014; all cattle tested negative. Awaiting disposition of final two traces.

Updates: None

FY 2012

Idaho

- Affected privately owned bison herd: A privately owned bison herd (268 head), assembled and located in the DSA in 2010, was brucellosis tested to meet Idaho's DSA requirements. Quarantine and movement controls are in place. An updated affected herd management plan is pending owner's signature. All trace-out and trace-in epidemiological investigations associated with this herd have been completed and closed. A whole-herd brucellosis test was conducted on December 4-5, 2013, and all animals were negative. Herd test was completed on November 2014 – all 278 animals were test negative. This was the second negative complete whole-herd test. On December 15-16, 2014, 214 bull and heifer calves (2014 calves) were tested with all having negative results. Next whole herd test is scheduled for fall 2015.

Updates: Fall testing completed November 18th. Entire herd tested negative. This was the final

negative whole herd test and the quarantine for this ranch released December 2, 2015. Assurance test will be scheduled for fall 2016

FY 2011

Montana

- Affected privately owned bison herd: A brucellosis-affected privately owned bison herd was detected in Gallatin County in November 2010. This herd was detected as part of Montana's DSA herd management plan testing. This herd is under quarantine with movement controls and an affected herd management plan in place. All trace-out and trace-in epidemiological investigations associated with this herd have been completed and closed. The fall 2013 test detected 13 seropositive (*B. abortus* biovar 1 isolated) animals out of 4050 head of bison tested. Annual fall testing began October 20, 2014, and was completed November 21, 2014. At the conclusion of the annual fall testing, 16 reactors and 3 suspects had been identified. Fall testing in 2015 concluded November 6th, with a final count of two suspects and six reactors identified out of 3262 head tested.

Updates: Next test will be fall 2016.

Wyoming

- Affected bison herd: A brucellosis-affected privately-owned bison herd inside the Wyoming DSA (Park County) was disclosed in November 2010. This herd consists of two groups – the Main herd and the Preferred herd. The Preferred herd has undergone four negative brucellosis tests and was released from quarantine in late January 2012. The Main herd remains under quarantine with movement controls and an affected herd management plan in place. All trace-out and trace-in epidemiological investigations associated with this herd have been completed and closed. June 2015 Main herd whole herd test results – all animals were negative. Next whole herd test of Main herd females is scheduled for fall 2015 and if negative would be the 3rd negative test for this portion of the herd. Test of 20 herd bulls July 14, 2015, showed all negative results.

Updates: Final bull testing completed November 15, 2015, and all animals were negative. This was the final negative whole herd test and the quarantine for this ranch released November 18, 2015. An assurance test will be scheduled for next year. The owner plans on testing the entire herd annually.

Table 3: Livestock herds confirmed as brucellosis affected, FY 2011-2015.

State/ FY	Method of Detection	Herd Type	Affected Herd Management Plan	Genotyping Descriptive Results	Wildlife Surveillance Planned	Animals Being Traced	States Receiving Traced Cattle/Bison
WY 2016	DSA Required pre- movement test	Beef	Quarantine with test & remove	Pending	Yes	Pending	Traces are pending
MT 2015	DSA Herd Plan Test	Beef	Quarantine with test & remove	Most closely related to 2 elk isolates (2009 – 2010)	Yes	Pending	Traces are pending
MT 2015	DSA Herd Plan Test	Beef	Quarantine with test & remove	Closest common ancestor – wild bison (1985)	Yes	Pending	Traces are pending
MT 2013	DSA Required pre-slaughter testing	Beef	Quarantine with test & remove	Common ancestor with wild elk from the same area	Yes	424	0 trace-in States 9 trace-out States: 20 of 22 traces completed (CA-1, ND-1; open) (MN-1, CO-1, IA-1, KS- 1, MN-1, MT-12, SD-1, NE-2; closed)
ID 2012	DSA required test	Bison	Quarantine with test & remove	Similar to ID elk isolates	No	349	All trace-ins closed. All trace-outs closed.
MT 2011	DSA herd management plan testing	Bison	Quarantine with test & remove	Exact match to a 2009 MT elk isolate	Yes	7510	All trace-ins closed. All trace-outs closed.
WY 2011	Pre-sale test on farm	Bison	Main herd remains under quarantine with test & remove.	Similar to 2007 & 2010 WY elk & 2010-2011 cattle isolates.	Yes	870	All trace-ins closed. All trace-outs closed.
