Operational Activities: Waterfowl

Last Modified:

Waterfowl are federally-protected migratory birds that are valuable natural resources enjoyed by birdwatcher's and the general public. Integrated solutions to address problems may include habitat manipulation, dispersal techniques, and population management.

Biology and Ecology

[Canada Geese](#)

[Two behaviorally distinct types of goose populations exist in most parts of the country: resident and migratory. Resident geese nest within the lower 48 states and the District of Columbia from March to June or reside there from April to August. Migratory Canada geese move between breeding grounds in Canada and overwintering areas in the United States but do not nest in the lower 48 states.](#)

Mute Swan

The mute swan is an exotic species that was introduced to the United States beginning in the mid-1800s. The largest concentration of mute swans now occurs along the Atlantic Coast from Maine to South Carolina, and it has increased steadily since the 1970's. Smaller flocks occur in the Great Lakes region and the Pacific Northwest.

Mallard

The mallard is the most abundant duck species in North America and has adapted to varied habitats. The mallard survives in cold climates and is tolerant of human activities. Although the mallard is the most heavily hunted duck species in North America, its populations remain steady.

Understanding Wildlife, Damage, and Management

Conflicts with People

Although most people find a few birds acceptable, problems quickly develop as bird numbers increase. These problems include overgrazing of grass and ornamental plants; accumulation of droppings and feathers; attacks on humans by aggressive birds; and the fouling of reservoirs, swimming areas, beaches, docks, lawns, and golf courses. Flocks of geese and other waterfowl also feed on a variety of crops, including corn, soybeans, rice, lettuce, winter wheat, barley, and rye.

Damage to Property

Canada goose nests occur near sidewalks and entryways of homes and other buildings, adjacent to paths and roadways, and on rooftops and porches. They are also found in more traditional areas, including parks and other open space. Flocks can leave behind a large amount of fecal material, especially if they routinely use the same sites. The feces can reduce the water quality of ponds and spoil the lawns of parks, golf courses, apartment complexes, and business parks. Mallards, wigeons, and coots also flock in parks and residential developments and cause similar problems.

Damage to Agriculture

Migratory waterfowl cause damage to agricultural crops in many parts of the United States. Crops are vulnerable to damage by ducks, coots, and geese through direct consumption of crops as well as trampling and fouling. Some waterfowl also cause problems at aquaculture facilities by feeding on fish fry and fingerlings.

Health and Safety Concerns

Defense of nests and young by geese and swans can result in injuries to people who approach too closely. Populations of waterfowl may contaminate recreational areas with pathogenic bacteria that may pose human-health risks. Waterfowl on or near airports affect public safety due to the possibility of bird-aircraft collisions.

Damage to Natural Resources

Canada goose and mute swans may impact native wild rice, restored wetlands, and tidal marshes when large flocks graze on vegetation and trample plantings. Resident Canada goose and non-native Mute Swans may out-compete native waterbirds and waterfowl for habitat and food. Resident Canada goose and non-native Mute Swans may out-compete native waterbirds and waterfowl for habitat and food. Additionally, overabundance of ducks, geese and swans in natural areas may cause erosion and reduce water quality due to feces and runoff.

Regulations Pertaining to Damage Management

The U.S. Fish and Wildlife Service has adopted new rules for managing resident Canada geese including a nest and egg depredation order for resident Canada geese that authorizes private landowners, public land managers, homeowners' associations, and local governments to destroy resident Canada goose nest and eggs on property under their jurisdiction when necessary to resolve or prevent injury to people, property, agricultural crops, or other interests.

A Migratory Bird Depredation permit or other authorization must be obtained from the U.S. Fish and Wildlife Service (FWS), and State laws must be consulted and adhered to, prior to initiating actions to remove waterfowl or handle their nests and eggs.

Resident Canada Goose Regulations

The Canada Goose Nest and Egg Depredation Order (50 CFR 21.162) authorizes landowners and local governments who register with the FWS to destroy resident Canada goose nests and eggs on their property from March 1-June 30, when necessary, to resolve or prevent injury to people, property, agricultural crops, or other interests. In order to conduct these activities, landowners must register online anytime between January 1 and June 30 of the year in which the activity will take place.

50 CFR 21.159 - Control Order for Resident Canada Geese at Airports and Military Airbases

Managers of commercial, public, and private airports and military air operation facilities acting under authority of 50 CFR § 21.159 may take Canada geese (including nests and eggs) from on or within 3 miles of the airport or airfield boundaries, without a Federal permit.

- [Control Order for Resident Canada Geese at Airports and Military Airfields \(50 CFR § 21.159\)](#)

50 CFR 21.165 - Depredation Order for Resident Canada Geese at Agricultural Facilities

Agricultural producers acting under authority of 50 CFR § 21.165 may take Canada geese from lands that they personally control and where geese are committing damage to agricultural crops, without a Federal permit.

- [Depredation Order for Resident Canada Geese at Agricultural Facilities \(50 CFR § 21.165\)](#)

50 CFR 21.168 - Public Health Control Order for Resident Canada Geese

States, Tribes, and the District of Columbia, via the State or Tribal wildlife agency, are authorized to take Canada geese without a Federal permit, wherever a Federal, State or local public health agency has determined that Canada geese pose a specific, immediate human health threat by creating conditions conducive to the transmission of human or zoonotic pathogens.
