

## USDA, Wildlife Services: Rabies Research in Burlington, VT

Biologists will be live trapping raccoons and skunks in the Greater Burlington area during summer and fall of 2016 to monitor the success of oral rabies vaccines used to limit the spread of rabies in wildlife. Biological samples will be collected from each captured animal, which then will be released. Some animals will also be radio-collared and tracked using telemetry to better understand urban wildlife ecology.

Your participation is critical to this program's success. Residents living within the study area will receive additional information and a live trapping permission slip through the mail. If you would like to assist in this important research project, please sign the permission form and return it in the self-addressed stamped envelope. Thank you!
