While best efforts have been used in developing and preparing the FAD PReP/NAHEMS Guidelines, the US Government, US Department of Agriculture (USDA) and the Animal and Plant Health Inspection Service and other parties, such as employees and contractors contributing to this document, neither warrant nor assume any legal liability or responsibility for the accuracy, completeness, or usefulness of any information or procedure disclosed. The primary purpose of these FAD PReP/NAHEMS Guidelines is to provide guidance to those government officials responding to a foreign animal disease outbreak. It is only posted for public access as a reference.

The FAD PReP/NAHEMS Guidelines may refer to links to various other Federal and State agencies and private organizations. These links are maintained solely for the user’s information and convenience. If you link to such site, please be aware that you are then subject to the policies of that site. In addition, please note that USDA does not control and cannot guarantee the relevance, timeliness, or accuracy of these outside materials. Further, the inclusion of links or pointers to particular items in hypertext is not intended to reflect their importance, nor is it intended to constitute approval or endorsement of any views expressed, or products or services offered, on these outside websites, or the organizations sponsoring the websites.

Trade names are used solely for the purpose of providing specific information. Mention of a trade name does not constitute a guarantee or warranty of the product by USDA or an endorsement over other products not mentioned.

USDA prohibits discrimination in all its programs and activities on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, sexual orientation, or marital or family status. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA’s TARGET Center at (202) 720-2600 (voice and telecommunications device for the deaf [TDD]).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 1400 Independence Avenue SW, Washington, DC 20250-9410 or call (202) 720-5964 (voice and TDD). USDA is an equal opportunity provider and employer.
PREFACE

The Foreign Animal Disease Preparedness and Response Plan (FAD PReP)/National Animal Health Emergency Management System (NAHEMS) Guidelines provide the foundation for a coordinated national, regional, State, and local response in an emergency, complementing non-Federal preparedness activities. These guidelines may be integrated into preparedness plans of other Federal agencies, State and local agencies, Tribal Nations, and additional groups involved in animal health emergency management.
Several key APHIS documents complement the NAHEMS Guidelines: Quarantine and Movement Control and provide further details. These documents include the following:

- APHIS Foreign Animal Disease Framework: Roles and Coordination (FAD PReP Manual 1-0)
- APHIS Foreign Animal Disease Framework: Response Strategies (FAD PReP Manual 2-0)
- Foot-and-Mouth Disease Response Ready Reference Guide—Quarantine, Movement Control, and Continuity of Business
- Classification of Phases and Types of a Foot-and-Mouth Disease Outbreak and Response.
- FAD PReP/NAHEMS Guidelines:
  - Continuity of Business
  - Biosecurity
- FAD PReP Standard Operating Procedures
  - 9. Biosecurity

1. INTRODUCTION

In a foreign animal disease (FAD) incident, control and containment of the disease agent is essential to eradication and recovery. Quarantine and movement control (QMC) are critical activities to protect animal health, by helping to ensure that the disease agent is not transmitted to non-infected livestock and poultry populations. QMC stops and controls movements in a regulatory Control Area. In an incident, quarantines and movement controls are handled through Incident Command. This document provides a broad overview of QMC activities that could be implemented for a disease incident.

1.1 Defining Quarantine and Movement Control

For the purpose of this document, “quarantine” refers to imposing stringent restrictions on entering or leaving a premises, area, or region where disease is known to exist or is suspected. During an FAD outbreak, a quarantine broadly prohibits the movement of animals, animal products, and fomites (e.g. equipment, vehicles, clothing, footwear) from a specified premises, area, or region. This protects unaffected animal populations by containing the FAD and reducing disease transmission. In the case of a zoonotic disease, a quarantine can also protect public health.1

The term “movement control” refers to controlling the movement of animals, animal products, and fomites in a regulatory Control Area. These movements are from non-infected premises, require permits, and are based on specific criteria. These criteria help to ensure that such movement poses a negligible risk of pathogen transmission.

The term “continuity of business” (COB) is a specific type of movement control known as managed movement. COB typically focuses on a specific commodity and is intended to mitigate the economic effects of a regulatory Control Area. COB is briefly discussed in this document; more information is available in the FAD PReP/NAHEMS Guidelines: Continuity of Business.

1.2 Purpose & Scope of Document

1.2.1 Purpose

The purpose of this document is to provide stakeholders with a broad understanding of QMC and to explain how QMC activities would occur in an FAD incident, from the perspective of the United States Department of Agriculture (USDA), Animal and Plant Health Inspection Service (APHIS), Veterinary Services (VS).

This document

• describes the QMC measures that may be considered necessary in an FAD incident,

1 For a zoonotic disease, State, Tribal, and Federal authorities exist to quarantine and/or isolate individuals to stop the spread of disease. Therefore, controlling the movement of and/or quarantining of individuals are topics outside the scope of this document; however, USDA will work closely with public health authorities in any zoonotic disease outbreak. For more information on public health authorities, please see the following: http://www.cdc.gov/quarantine/pdf/legalAuthoritiesIsolationQuarantine.pdf.
provides general information for personnel in an Incident Command that may be involved with QMC activities, and emphasizes the need for strong cooperation between local, State, and Federal levels, and with private industry, in order to effectively respond to an FAD and conduct QMC activities.

1.2.2 Scope

This document focuses on diseases spread by direct and indirect contact rather than vector-borne diseases, as QMC is not particularly effective at preventing the movement of mobile insect vectors. However, QMC activities can still prevent the movement of infected hosts, which may be important in vector-borne FAD incidents.

While QMC activities can be essential to rapidly contain an FAD, these activities can also cause significant disruptions in typical business operations and result in severely restricted intrastate and interstate commerce. It is difficult to quantify the economic impact of potential disruptions, but current agricultural production and marketing systems rely on frequent—even daily—movement. For example, just-in-time production in the swine industry, and daily movement of milk in the dairy industry, means that QMC activities would cause severe interruptions, even if movement was stopped for a short period of time. Severe economic consequences would result. In response to this problem, COB plans (also known as managed movement plans) for non-infected animals and non-contaminated animal products—known as the Secure Food Supply Plans—have been established to mitigate economic effects of QMC. These Plans are discussed in Section 6.2, but further information is found in the FAD PReP/NAHEMS Guidelines: Continuity of Business.

This document is written from a USDA APHIS perspective, acknowledging that Incident Command will be a Unified Command with State, Tribal, and local personnel.

1.3 Goals of an FAD Outbreak Response

QMC activities are a critical component of a response effort. The three goals of an FAD outbreak response are as follows:

To: (1) detect, control, and contain the FAD in animals as quickly as possible; (2) eradicate the FAD using strategies that seek to stabilize animal agriculture, the food supply, and the economy, and to protect public health and the environment; and (3) provide science- and risk-based approaches and systems to facilitate COB for non-infected animals and non-contaminated animal products.

Achieving these three goals will allow individual livestock facilities, States, Tribes, regions, and industries to resume normal production as quickly as possible. They will also allow the United States to regain FAD-free status without the response effort causing more disruption and damage than the disease outbreak itself.

1.4 Goals of Quarantine and Movement Control

QMC-specific goals support overall FAD response goals.

1.4.1 Preparedness Goals

Preparedness goals are as follows:

- To work with stakeholders to develop effective QMC plans for affected premises, areas, or regions.
• To work with stakeholders to develop effective movement control and permit plans for non-infected premises, areas, or regions.

1.4.2 Response Goals

The response goals are as follows:

• Once a Control Area has been established, implement QMC as rapidly as possible.
• Ensure QMC considers competing priorities, weighing the risk of disease transmission against the need for critical movements (e.g., feed trucks) and business continuity.

2. AUTHORITIES

The Code of Laws of the United States of America (U.S.C.) and the Code of Federal Regulations (CFR) are codified authorities representing different stages of the legislative process. The U.S.C. provides the general and permanent statutes of the United States, which are passed by Congress and signed by the President. Executive branch agencies then interpret the U.S.C., developing detailed regulations in the CFR. The CFR is developed through a public rulemaking process, where the public is allowed to comment. For more information, please see the APHIS Foreign Animal Disease Framework: Roles and Coordination (FAD PReP Manual 1-0).

In an FAD incident response, the U.S.C. and CFR provide policy, via statutes and regulations, for USDA; interim regulations can be implemented—in the event of an outbreak—to prevent the spread of disease.

2.1 USDA APHIS Authorities for Foreign Animal and Emerging Diseases

An FAD is a terrestrial animal disease or pest, or an aquatic animal disease or pest, not known to exist in the United States or its territories. An emerging animal disease is any terrestrial animal, aquatic animal, or zoonotic disease not yet known or characterized, or any known or characterized terrestrial animal or aquatic animal disease in the United States or its territories that changes or mutates in pathogenicity, communicability, or zoonotic potential to become a threat to terrestrial animals, aquatic animals, or humans. An FAD or emerging animal disease may involve livestock, poultry, other animals, and/or wildlife.

In the event of an FAD or emerging animal disease outbreak in domestic livestock that involves wildlife, USDA APHIS will work in close collaboration, communication, and coordination with State, Tribal and Federal wildlife agencies that have primary jurisdictional authority and subject matter expertise for wildlife.

For information on the procedures for an FAD investigation and specimen submission, including for Foreign Animal Disease Diagnosticians, please see VS Guidance Document 12001 (previously APHIS VS Memorandum 580.4) and the Foreign Animal Disease Investigation Manual (FAD PReP Manual 4-0).

2.1.1 Animal Health Protection Act

APHIS receives its permanent and general regulatory authority from the Animal Health Protection Act (AHPA), 7 U.S.C. 8301 et seq.

The AHPA enables the Secretary of Agriculture to prevent, detect, control, and eradicate diseases and pests of animals, including foreign animal and emerging diseases, in order to protect animal health, the health and welfare of people, economic interests of livestock and related industries, the environment, and interstate and foreign commerce in animals and other articles. The term “animal” means any member of the animal kingdom (except a human), 7 U.S.C. 8301-8302. The Secretary is specifically authorized to
carry out operations and measures to detect, control, or eradicate any pest or disease of livestock, which includes poultry, 7 U.S.C. 8308, and to promulgate regulations and issue orders to carry out the AHPA (7 U.S.C. 8315). The Secretary may also prohibit or restrict the importation, entry, or interstate movement of any animal, article, or means of conveyance to prevent the introduction into or dissemination within the United States of any pest or disease of livestock (7 U.S.C. 8303-8305).

2.1.2 Code of Federal Regulations

Title 9 of the CFR provides detailed USDA APHIS administrative regulations for the control and eradication of animal diseases, including FADs and emerging animal diseases. Below are several key sections of the CFR to safeguard public health, animal health, animal products, interstate commerce, and international trade. Please refer to the APHIS Foreign Animal Disease Framework: Roles and Coordination (FAD PReP Manual 1-0) for more information:

- 9 CFR 71.2
  - Secretary (of Agriculture) to Issue Rule Governing Quarantine and Interstate Movement of Diseased Animals, Including Poultry
- 9 CFR 71.3
  - Interstate Movement of Diseased Animals and Poultry Generally Prohibited
- 9 CFR 53
  - Foot-and-Mouth Disease, Pleuropneumonia, Rinderpest, and Certain Other Communicable Diseases of Livestock or Poultry
- 9 CFR 161
  - Requirements and Standards for Accredited Veterinarians and Suspension or Revocation of Such Accreditation.

2.2 State Authority in an FAD Outbreak

Initial FAD response, and enforcement of QMC, will involve State, Tribal, and local authorities and resources. Authority granted to the State Animal Health Official (SAHO) varies from State to State. Legal authority is granted via statute by a legislating body, and regulations are promulgated by an executive agency under this statutory authority. Quarantine on a premises—or movement restrictions—within a Control Area may be issued, based on an FAD detection or a suspected FAD. These may include quarantines of an individual pen, herd, flock, premises, county, section, or area, depending on the specific State authority. Since statutes and regulations vary by State, it is important to become familiar with and follow the laws and regulations of your State, Tribal Nation, and/or locality. State quarantines are used to stop and control the spread of an infectious or contagious disease within a State.

2.3 Extraordinary Emergency

While typically States control intrastate movements, it is important to recognize that if the United States Secretary of Agriculture declares an Extraordinary Emergency, the Federal government is then authorized to control intrastate movement, in addition to interstate movement and international movement.

Additionally, an FAD outbreak in the United States may result in emergency regulatory intervention by State, Tribal Nations, and Federal authorities via a Unified Command.

---

2 While this section focuses on USDA APHIS authority, please note that the Centers for Disease Control and Prevention has the authority, per the Public Health Service Act, and 42 CFR 70.2 to “take such measures to prevent such spread of diseases as he/she deems reasonably necessary, including inspection, fumigation, disinfection, pest extermination, and destruction of animals or articles believed to be sources of infection.”
### 3. RESPONDING TO AN FAD: GENERAL INFORMATION

#### 3.1 Epidemiological Principles of Response

The need for QMC activities is based on the three basic epidemiological principles of response. These three principles form the foundation of any FAD response strategy to contain, control, and ultimately eradicate the disease in the U.S. domestic livestock or poultry population.

1. *Prevent contact between the disease and susceptible animals.*
   a. This is accomplished through quarantine of infected animals, movement controls in the Infected Zone(s) and Buffer Zone(s) (Control Areas), and biosecurity procedures to protect non-infected animals.
   b. Certain circumstances may warrant accelerating the depopulation of animals at risk for exposure to the disease to decrease the population density of susceptible animals.
   c. There is a serious but lesser transmission risk posed by people, material, conveyances, and non-susceptible animals that may have been in contract with the disease and serve as mechanical vectors. Contact with susceptible animals should be prevented and transmission risk mitigated through biosecurity and cleaning and disinfection measures.

2. *Stop the production of the disease agent.* This is accomplished by the slaughter or mass depopulation (and disposal) of infected and potentially infected animals.

3. *Increase the disease resistance of susceptible animals or reduce the shedding of the disease agent in infected or exposed animals.* This can be accomplished by emergency vaccination if a suitable vaccine is available and can be administered in a timely manner.

#### 3.2 Critical Activities

During an FAD response, many activities must be conducted simultaneously to achieve the goals of an FAD response. Box 1 lists some of the critical activities which occur in an FAD outbreak, including QMC. Other activities, such as surveillance, diagnostic testing, COB, disposal, and vaccination will also help to rapidly and effectively control, contain, and eradicate the disease.

**Box 1. Critical Activities and Tools for an FAD Response**

<table>
<thead>
<tr>
<th>Critical Activities and Tools for Containment, Control, and Eradication</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Public awareness campaign</td>
</tr>
<tr>
<td>• Swift imposition of effective QMC</td>
</tr>
<tr>
<td>• Rapid diagnosis and reporting</td>
</tr>
<tr>
<td>• Epidemiological investigation and tracing</td>
</tr>
<tr>
<td>• Increased surveillance</td>

</tr>
<tr>
<td>• Biosecurity measures</td>
</tr>
<tr>
<td>• Cleaning and disinfection measures</td>
</tr>
<tr>
<td>• Effective and appropriate disposal procedures</td>
</tr>
<tr>
<td>• Mass depopulation and euthanasia (as response strategy indicates)</td>
</tr>
<tr>
<td>• Emergency vaccination (as the response strategy indicates)</td>
</tr>
</tbody>
</table>

Figure 1 shows the critical activities that will take place within the first 72 hours of an outbreak. These critical tasks are fundamental to the rapid control and containment of the disease.
3.3 Zone, Area, and Premises Designations

Immediately after an FAD detection, a regulatory Control Area—comprised of an Infected Zone and Buffer Zone, will be designated. Quarantines will be implemented for Infected, Contact, and Suspect Premises in this regulatory Control Area. As the epidemiological investigation continues, the incident is likely to become more complex, demanding additional resources. Response zones and areas are likely to change over the course of an incident. For a summary of these designations, please see Tables 1 and 2 and Figure 2. Table 3 provides information on minimum zone sizes for most FADs; Table 4 provides information on minimum zone sizes for mosquito or culicoides-borne diseases.
## Table 1. Summary of Premises Designations

<table>
<thead>
<tr>
<th>Premises</th>
<th>Definition</th>
<th>Zone</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infected Premises (IP)</td>
<td>Premises where a presumptive positive case or confirmed positive case exists based on laboratory results, compatible clinical signs, case definition, and international standards.</td>
<td>Infected Zone</td>
</tr>
<tr>
<td>Contact Premises (CP)</td>
<td>Premises with susceptible animals that may have been exposed to the FAD, either directly or indirectly, including but not limited to exposure to animals, animal products, fomites, or people from Infected Premises.</td>
<td>Infected Zone, Buffer Zone</td>
</tr>
<tr>
<td>Suspect Premises (SP)</td>
<td>Premises under investigation due to the presence of susceptible animals reported to have clinical signs compatible with the FAD. This is intended to be a short-term premises designation.</td>
<td>Infected Zone, Buffer Zone, Surveillance Zone, Vaccination Zone</td>
</tr>
<tr>
<td>At-Risk Premises (ARP)</td>
<td>Premises that have susceptible animals, but none of those susceptible animals have clinical signs compatible with the FAD. Premises objectively demonstrates that it is not an Infected Premises, Contact Premises, or Suspect Premises. At-Risk Premises seek to move susceptible animals or products within the Control Area by permit. Only At-Risk Premises are eligible to become Monitored Premises.</td>
<td>Infected Zone, Buffer Zone</td>
</tr>
<tr>
<td>Monitored Premises (MP)</td>
<td>Premises objectively demonstrates that it is not an Infected Premises, Contact Premises, or Suspect Premises. Only At-Risk Premises are eligible to become Monitored Premises. Monitored Premises meet a set of defined criteria in seeking to move susceptible animals or products out of the Control Area by permit.</td>
<td>Infected Zone, Buffer Zone</td>
</tr>
<tr>
<td>Free Premises (FP)</td>
<td>Premises outside of a Control Area and not a Contact or Suspect Premises.</td>
<td>Surveillance Zone, Free Area</td>
</tr>
<tr>
<td>Vaccinated Premises (VP)</td>
<td>Premises where emergency vaccination has been performed. This may be a secondary premises designation.</td>
<td>Containment Vaccination Zone, Protection Vaccination Zone</td>
</tr>

---

4. **GENERAL CONSIDERATIONS FOR QUARANTINE AND MOVEMENT CONTROL**

QMC activities are important interventions to control and contain an FAD. Usually Federal quarantines and movement restrictions are instituted to control *interstate* and *international* movement of infected animals and contaminated animal products; States may restrict the *intrastate* movement of animals, animal products, equipment, and other items.
4.1 Coordination and Cooperation

A highly contagious FAD will involve Federal authority, resources, and expertise closely coordinated with State, local, and Tribal government authority and resources. Partners in the private sector (e.g., industry and academia) may also be involved. These stakeholders will need to respond in a coordinated and mutually supportive manner. The SAHO and the APHIS Assistant District Director (ADD) will need to cooperate on all aspects of a significant disease response. In addition to State imposed quarantines, Federal quarantines will be implemented as required by the situation or requested by the SAHO. The difference in a State and Federal quarantine is discussed in Section 5.1 and 5.2.

Additionally, Federal officials and SAHOs will need to work closely with emergency management agencies that may assist in identifying and coordinating support from State and local resources, including, but not limited to, public works departments, departments of transportation, departments of wildlife and natural resources, law enforcement, public health, universities, and local contractors. Veterinary reserve groups, such as the National Animal Health Emergency Response Corps (NAHERC) may be activated. Please see Section 4.3 which describes Incident Command, or the structure in which these different responders would be integrated in an incident.

It is important that the goals of controlling, containing, and eradicating the FAD are shared and consistent across all involved in responding to the incident.

4.2 Planning

The economic impact of a highly contagious disease of livestock or poultry is directly affected by the time it takes to control, contain, and eradicate the outbreak. QMC is complex, involving multiple agencies with different areas of authority and responsibility. Livestock producers and processors will need to cooperate and collaborate in the planning and implementation process. Planning for an emergency is critical in order to develop a consistent, systematic approach to respond to a regional or multi-State disease outbreak.

State protocols for imposing quarantines do exist, but vary from State to State based on a State’s legal authority. Few States have comprehensive plans covering all the complexities of QMC during an animal health incident. Planning, on every level—including for industry—should consider including the following:

- Determining the legal authority and protocol for issuing, lifting, and enforcing a quarantine.
- Clarifying the agencies with the authority for aspects of movement control, such as biosecurity, cleaning and disinfection, permitting, traffic control, enforcement, and road maintenance.
- Identifying resources that are trained and ready; resources that need to be developed; private resources that may be or could be available.
- Identifying major agricultural routes (livestock and pick-up/delivery of products such as milk and feed) and suitable checkpoint sites on those routes.
- Developing a communications plan to include the ability to exchange information between checkpoints, as well as through the chain of command to the Incident Commander.
- Developing a communications plan, in coordination with Incident Command, to communicate to the public about QMC activities.
- Ensuring appropriate personal protective equipment and disinfectants are available for use during QMC activities (or developing a plan for acquiring such materials).
- Develop agreements with other agencies for sharing resources.
- Understanding the different roles and responsibilities of those involved in the response.
4.3 Response Incident Command Structure

Incident response will be handled through the Incident Command System (ICS), based on the National Response Framework (NRF) and the National Incident Management System (NIMS). Coordination of priorities and resources will be conducted through ICS in an incident. The Animal Movement and Permits Group, or other personnel as designated by the Incident Commander, will be assigned responsibility for QMC activities (Appendix B includes an example ICS structure, highlighting the Animal Movement and Permits group under the Disease Support Branch).

4.4 Understanding the Continuum of Activities

The purpose of QMC activities are to keep an FAD out of non-infected livestock and poultry populations (e.g., herds, flocks, or other groups of animals) to stop the spread of a disease. This controls and contains the spread of the FAD, leading to eradication. QMC stops or severely limits the movement of animals, products, fomites, vehicles and equipment. QMC can affect the ability of a producer or processor to continue key operations during an outbreak; business processes, including the production and distribution, may be disrupted.

COB, on the other hand, manages the movement of non-infected animals and non-contaminated animal products in a regulatory Control Area. Managed movement involves the development and implementation of science- and risk-based systems and protocols to help agriculture and food industries maintain essential business functions, or return to business during an FAD response, while the risk of disease spread and threat to public health is effectively managed. The ultimate goal of COB is to minimize unintended negative effects of the disease and disease response on the affected industries and consumers while still achieving the goals of a disease response.

Box 2 explains how QMC and COB (managed movement) are integrated in an FAD outbreak; Figure 3 provides an illustration of how the activity may change as the outbreak progresses. QMC and COB both help to achieve the goals of an FAD response.

Box 2. Quarantines, Movement Controls, and Continuity of Business (Managed Movement)

How does COB Work with QMC?
Quarantines, movement controls, and COB have the same ultimate goal: to prevent the transmission of the FAD to non-infected premises, particularly those outside the Control Area. While quarantines and movement controls are highly effective at limiting the spread of disease, they also impede typical business operations—this is when COB plans enter into response efforts to effectively manage movement.

- **Quarantines and movement controls** are applied to premises in the regulatory Control Area to ensure infected animals, fomites, and products do not leave premises. Quarantines are applied to Infected, Contact, and Suspect Premises. Movement controls are applied to At-Risk and Monitored Premises. Consideration will be given to critical movements (i.e., feed trucks).
- **COB or managed movement** is intended to manage movement for the non-infected premises (At-Risk and Monitored Premises) in a regulatory Control Area, and to facilitate movement within and out of the Control Area.
Transfiguring between these phases requires effective preparedness planning ahead of an event between all relevant partners.

### 4.5 Competing Priorities

There are many activities that compete for limited resources in an event; a major challenge in preparing for and responding to FAD outbreaks is successfully managing these interests during the response. A priority of preparedness planning should be to discuss, mitigate, or resolve competing priorities prior to an incident. This can be accomplished by identifying required resources, establishing mutually accepted response goals and objectives amongst stakeholders, and increasing the awareness of these competing priorities. As each agriculture sector develops their disease specific COB plans, it is critical that incident goals, guidelines, strategies, and procedures are coordinated with Federal, State, Tribal, and local planning efforts.

### 5. Quarantines

In an FAD outbreak, there may be both State quarantines and Federal quarantines. A response effort will begin locally, involving local, State, and Tribal authority and resources. If needed, Federal authority and resources will then be employed.

Incident Command should make a strong effort—including clear communication and appropriate educational materials on disease transmission—to gain voluntary compliance from producers, families, and others involved in the quarantine.

#### 5.1 Individual Premises Quarantine (Typically State Quarantine)

5.1.1 Issuance of Individual Premises Quarantine

Issuance of a State quarantine on an individual premises may be made on a presumptive positive diagnosis, pending laboratory confirmation, or only on the basis of a confirmed positive. The authority of the SAHO varies by State, and is typically codified in statute or legislation.

Depending on State authority, it may be possible to initially institute a “hold order” on a premises; this hold order effectively quarantines a premises and stops animal and fomite movement while diagnostic testing or additional epidemiological investigation is being completed to determine whether an official (and less temporary) quarantine notice is necessary.

An individual premises quarantine or hold order is typically requested by a foreign animal disease diagnostician (FADD) who has conducted an investigation and determines the findings are consistent with “High Suspicion of an FAD” as stated in APHIS VS Guidance 12001. This determination is made when “the findings are consistent with an FAD and are generally inconsistent with an endemic disease/condition, or are discordant with an endemic disease/condition.”
While the quarantine may initially be verbal, a written and signed quarantine order should be presented to the owner or manager of the premises as soon as possible, or as required by the laws of the State involved. The SAHO and APHIS VS ADD should be notified immediately of either a verbal or a written quarantine or hold order. They should also be made aware of any support that may be necessary from outside the premises to enforce the quarantine or hold order and begin disease control and eradication operations on the premises.

5.1.2 Steps for Implementing Premises Quarantine

Infected Premises, Contact Premises, and Suspect Premises are subject to individual premises quarantine. Quarantines may be imposed on facilities with live animal inhabitants (farms or feedlots), as well as those without resident live animals (auction markets). Box 3 summarizes the steps involved in implementing a premises quarantine.

Box 3. Steps Involved in Implementing Premises Quarantine

A team of personnel, led by a Team Leader, is assigned to one or more quarantined locations, and responsible for on-site implementation and enforcement of quarantine procedures and restrictions. This is accomplished in cooperation with other Incident Command groups also involved in essential response activities, such as biosecurity and cleaning and disinfection.

5.1.2.1 Notifying Owner/Agent

Ideally, quarantine notices should be personally served to an individual with immediate control of the animals or the premises where the animals are located. This could be the animal owner, but may be a resident, agent, property owner, property manager, or any combination thereof. At least three attempts to serve the notice should be made at different times of the day. Phone calls may be warranted. Document all attempts to deliver the quarantine notice.

In a large outbreak, it may not be possible to deliver notifications in person. The SAHO may authorize the action required by the notice on epidemiological grounds, if the disease situation requires immediate action. However, it is important to verify that notification has been received by owners/agents and those in immediate control of the animals or premises where the animals are located.

5.1.2.2 Securing a Quarantined Premises

A quarantined premises must be secured to ensure prohibited movement on and off the premises does not occur. Gaining owner cooperation is helpful, as the owner can control activity associated with the

FAD PReP/NAHEMS Guidelines: Quarantine and Movement Control (2014) 16
premises in order to maintain security. Animals on a quarantined premises should be accounted for in a premises census. This is important to prevent the spread of disease, including preventing the accidental escape or intentional removal of any animal from the premises. A sufficient supply of highly visible, weatherproof signs should be on hand so that adequate numbers of signs can be displayed to warn of restricted access and the security in place. Some States have the authority to enlist local law enforcement to help maintain and enforce a State-ordered quarantine.

5.1.2.3 Establishing Biosecurity Procedures

Biosecurity protocols will be established to inhibit the spread of the pathogen. This includes the proper maintenance, decontamination, and/or disposal of personal protective equipment. Work zones (Figure 4) will be established to enter and leave a quarantined premises. These work zones include the Hot Zone (Exclusion Zone), Warm Zone (Contamination Reduction Zone), and Cold Zone (Support Zone). A decontamination corridor restricts access through control access points, while allowing for essential movement. Response activities will require some essential personnel to enter and exit the premises. Prior to entering a premises, personnel should ensure they have all the proper equipment and supplies. A complete log of all movements should be established and monitored, including responders, employees, any emergency personnel, owners and their family, as well as any animals, animal products, vehicles, equipment, and other materials.

Figure 4. Work Zones

The risk of a quarantine being compromised by wildlife and/or vectors should be evaluated on a case-by-case basis. Consideration should be given to wildlife identified on, or near, an Infected Premises, based on species susceptibility to the FAD, risk of the species acting as a fomite, and their pattern of movement. APHIS will cooperate with State and Federal agencies with primary jurisdiction for wildlife, through Incident Command.

5.1.2.4 Contingency Planning

If a person on a quarantined premises is injured or becomes seriously ill, every effort must be made to aid and obtain medical care for the person as quickly as possible. This includes emergency transport to a medical facility; health and safety is the top priority. Assuming the risk of pathogen transmission exists, the team assigned to the quarantined premises should coordinate decontamination of the victim, if
possible to do so with interfering with essential treatment. Authorities at the medical facility may need to be informed of the risk of pathogen transmission, and cleaning and disinfection supplies and/or expertise may need to be provided for medical personnel, transport, and clothing.

For more information on health and safety issues that responders may encounter, and ways to plan for such events including a site-specific Health and Safety Plan, consult the FAD PReP/NAHEMS Guidelines: Health and Safety and the FAD PReP SOP: Health and Safety. Also see Section 8 below on personnel.

5.1.2.5 Movement

5.1.2.5.1 Essential Movements

While movement must be restricted to limit the spread of disease, allowances must be made for the humane care of animals (such as feed) and other necessary activities. This care will be necessary from the time the status of the animals is determined until they are released from quarantine, sent to slaughter, or depopulated.

People residing on the quarantined premises will need to enter and leave the site, as may some employees working on the premises. The most important measures required to accommodate such essential movements are the use of clean clothes and footwear, any personal protective equipment deemed appropriate, along with cleaning and disinfection of vehicles and equipment.

For additional information on biosecurity measures or cleaning and disinfection, please see the FAD PReP/NAHEMS Guidelines: Biosecurity, FAD PReP/NAHEMS Guidelines: Disinfection, FAD PReP SOP: Biosecurity, and the FAD PReP SOP: Cleaning and Disinfection.

5.1.2.5.2 Animals, Animal Products, and Fomites

Under an individual premises quarantine, movement from Infected Premises, Contact Premises, or Suspect Premises is generally prohibited except under specific circumstances determined and authorized by Incident Command. Movements determined necessary by Incident Command will be granted a specific permit for one-time movement. All movement will require biosecurity and cleaning and disinfection measures as specified by Incident Command.

For further information, please see Table 6, 7, and 8 which provide an overview of movements into, within, and out of the Control Area.

5.2 Area or Region Quarantine (Typically Federal Quarantine)

Historically, individual premises quarantines as discussed in Section 5.1 are applied under State authority rather than Federal authority. A Federal quarantine (or a Federal area quarantine) may be issued when requested by a SAHO, or as directed by the U.S. Secretary of Agriculture. As defined in 9 CFR 71, a quarantined area is as follows: “The States, Territories, or the District of Columbia or portions thereof quarantined by the Secretary of Agriculture for the specific contagious, infections, or communicable animal disease mentioned in each part.”

5.2.1 Implementing a Federal Area Quarantine

Federal area quarantines are typically applied to what was defined above as a regulatory Control Area. Factors used to determine this area are complex (see Table 5), and may be based on characteristics of the disease agent, trading partner considerations, State-specific issues, and the epidemiology of the outbreak. Federal personnel will work, through Incident Command, with State officials and others to determine the most appropriate Control Area for quarantine in an FAD outbreak. Federal area quarantines must appear
as a Federal Register Notice. Incident Command will supply the information necessary to the Documentation Unit (or designee) for a Federal Register Notice. However, Federal area quarantines can go into effect before the Federal Register Notice is published. Example of a Federal quarantine notice is provided in Appendix C.

A Federal quarantine may exist in addition to individual premises quarantines under State authorities. Under a Unified Command, State and Federal personnel are likely to be involved in establishing, securing, and maintaining a Federal quarantine. USDA may request that the affected States contribute resources to maintain and enforce the quarantine; USDA will reimburse States for this effort via cooperative agreement.

5.2.2 Implementing a Standstill

Prior to, or simultaneously with, the implementation of a Federal area quarantine, a standstill of livestock movements may be put into effect through a Federal Register Notice. A standstill notice would likely cover a broad geographical area, in order to limit animal movement (limiting disease spread), and facilitate a rapid evaluation of the epidemiology of the outbreak. To date, a Federal standstill notice has not been issued in past U.S. outbreaks.

During a standstill, the initiation of new movements of the susceptible animal species would be prohibited for a short period of time. Standstill after disease detection, such as the likely 24-hour standstill notice described in the Foot-and-Mouth Disease Response Plan, will have significant impacts on commerce, as well as unaffected producers and consumers. The benefits and consequences of a standstill, particularly in relation to length, should be considered carefully by Incident Command. In spite of the drawbacks, a standstill notice can be an important tool to significantly limit animal movement and potential spread of disease while a Control Area is being defined.

In order to implement a standstill, it is likely that a declaration of an Extraordinary Emergency would be required. The Federal government may also request that States voluntarily implement a standstill through State authority.

5.2.3 Note on State Area Quarantine Authority

States, in some cases, may elect to establish an additional quarantine area, which may extend beyond the boundaries of the Federal area quarantine (for example, to State borders). This may be to protect their State from disease incursion, or as a result of real or perceived disease-freedom by trading partners. In the event that States decide to do so, the establishment of this additional area—potentially including checkpoints or employing other resources—is likely outside the scope of the ICS and would probably not be supported by Federal resources or personnel.

5.3 Quarantine Violations and Appeals

5.3.1 Violations

Violations of a State quarantine order are usually handled by the State, and the investigation and penalties will be conducted and levied based on State laws and authorities. Violations of a Federal quarantine order are handled through APHIS Investigative and Enforcement Services (IES) through a referral by Incident Command. Investigations and penalties will be handled by IES. Documentation of the investigation of the violation would be tracked through the Emergency Management Response System (EMRS) 2.0 or a comparable data system. There may be cases in which Incident Command provides Federal resources, including IES, to States to handle individual premises quarantine violations.
Documentation of violations should be as thorough as possible, including information on the name of the individual or company, vehicle license plate number, type and number of items or animals transported, and time of arrival/departure.

5.3.2 Appeals

The appeal process may vary for quarantines imposed by the State. An appeal can be made by a property owner (or legal designee) in response to a Federal quarantine being imposed. The Incident Commander (or designee) should be immediately notified of any request for appeal. A hearing will take place, focusing on whether the animal population in question is infected, has been exposed to, is carrying, or is at risk of infection due to epidemiological evidence.

The hearing must usually occur within 48 hours of the request, and can be held by conference call. The hearing should include the Hearing Officer (designated within Incident Command, may be part of the Animal Movement and Permits Group), Epidemiologist, Incident Commander (or designee), and the owner. The SAHO may shorten the time for requesting an appeal as required to address the situation.

5.3.3 Non-Cooperative or Threatening Owners/Producers

During some incidents, it will be necessary for response personnel to gain access to private property in order to carry out their duties, including imposing premises quarantine. Personnel should always travel in teams. Owner’s reactions to a request to enter their property may vary. In the event that the actions, behavior, and/or language of an owner/occupant of a premises or another member of the public causes concern for any team member’s personal safety, personnel should leave the premises immediately. Depending on the severity and urgency of the situation, the team should call their supervisor or local law enforcement (police or sheriff). Field teams must document all non-compliance issues and safety concerns. The Incident Command may engage law enforcement assistance as necessary.

Personnel should do the following when confronted with a non-cooperative or threatening owner:

- Remain calm.
- Remember personal safety is the first priority.
- Avoid confrontation; a situation can escalate without warning.
- Depending on the threat, call their supervisor or local law enforcement.
- If law enforcement is required, the supervisor should also be notified.
- The public may be informed that they are interfering with a government employee performing official duties, and are in violation of U.S. Code (Title 18 Section 111).

5.4 Releasing Quarantine

State and Federal quarantine authorities will have different administrative processes for removal of a quarantine. Hand delivery or certified mail is the preferred method for quarantine release notices, particularly for small outbreaks. For larger outbreaks, or widespread outbreaks, other methods are acceptable.

5.4.1 Individual Premises Quarantine

Individual premises are typically released from quarantine prior to the release of the Federal area quarantine in which they are located. There are multiple steps involved in releasing individual premises from quarantine; Incident Command needs to have a high level of confidence that the premises, and surrounding premises in close proximity, are free from the disease agent.
Release of individual premises quarantine may come after the following activities occur (all activities may not be necessary, depending on the type of premises):

- depopulation,
- disposal of animals and contaminated products and materials,
- appropriate disposition of non-susceptible animals,
- complete cleaning and disinfection,
- downtime where the premises has been without animals,
- verification of the health status of the animals on the premises (may include visual and diagnostic surveillance),
- laboratory confirmation that there is no evidence of the disease agent,
- period of restocking, where disease surveillance occurs.

For more information on these requirements, please see the relevant FAD PReP/NAHEMS Guidelines: Biosecurity, Cleaning and Disinfection, and Disposal, as well as the FAD PReP SOPs on these subjects. Epidemiologists with Incident Command provide documentation to the teams assigned to the quarantined premises indicating that quarantine may be released.

5.4.2 Federal Area Quarantine

Regional or area quarantines are released after individual premises are released. As such, Federal area quarantines are typically in place until the end of an incident. A Federal Register notice will indicate the release of Federal quarantine. Decisions to release Federal quarantine will be based on multiple considerations and available information.

The entire area of a Federal quarantine does not need to be released simultaneously. There may be reasons—including, but not limited to trade considerations or epidemiologic information—to release portions of the Federal quarantine, in other words, reducing the size of the Control Area gradually before complete release of the entire Federal area quarantine. For example, if the country has been regionalized (trading partners are accepting animal products from specific areas of the country), and removing the Federal quarantine would result in trading partners denying U.S. exports, it may be necessary to maintain the Federal quarantine until trading partners agree that this portion of the country can also be considered disease-free.

6. MOVEMENT CONTROL

Movement controls are the critical activity which accompanies quarantines. The term “movement control” refers to controlling the movement of animals, animal products, and fomites in a regulatory Control Area. Criteria help to ensure that such movement poses a negligible risk of pathogen transmission. For individual premises, quarantines are imposed on Infected, Contact, and Suspect Premises, while movement controls focus on At-Risk and Monitored Premises. For areas or regions, movement controls guide movement into, out of, and within the regulatory area. In an incident, Incident Command will oversee all movement control (and subsequent permitting).

6.1 General Guidance for Moving Into, Out of, and Within a Control Area

These tables provide broad guidance for moving into, out of, and within a regulatory Control Area. For Infected, Contact, and Suspect Premises, movement is prohibited unless a specific permit is issued by Incident Command for essential movement. On the other hand, for At-Risk and Monitored Premises, common movements are allowed by permit (also called a blanket permit), based on specific criteria, these are the movements to which “movement control” refers. Note that not only is movement control for movements off of these types of premises, but also on to these types of premises and between these types
of premises. This ensures biosecurity and reduces the risk of further infected animals and disease transmission.

**6.2 Continuity of Business**

COB or managed movement is a specific type of movement control, which establishes specific criteria for the movement of commodities from premises. Participating in managed movement plans is voluntary. If producers choose to participate, specific criteria are required for movement. However, they assist in mitigating the impact of the Federal area quarantine. These movements are science- and risk-based, weighing the risk of disease transmission. Developed by public-private-academic partnerships, the criteria for these permitted movements typically require surveillance, cleaning and disinfection, biosecurity measures, and epidemiological information. For more information on COB, please see the *FAD PReP/NAHEMS Guidelines: Continuity of Business* as well as Appendix E.
6.3 Checkpoints

Checkpoints are intended to enforce movement control requirements. Conveyances moving out of the quarantined area may need to be accompanied by a permit for movement. This permit provides verification that a vehicle is properly cleaned and decontaminated and is transporting animals, fomites, or products in accordance with State and Federal laws and regulations.

For the Federal quarantine area, checkpoints could be staffed with Federal or State personnel, through the Incident Command. Law enforcement personnel or Department of Transportation personnel may also be engaged through Incident Command. Specific standard operating procedures for checkpoints will be provided through Incident Command; this section only provides a broad overview. Checkpoints will be maintained until the Incident Command decides they are no longer needed.

Further regulations for traffic control are available from the Federal Highway Administration in 23 CFR 655.

6.3.1 Locations

The specific location of a checkpoint should be determined by Incident Command, based on key access points to the regulatory Control Area, location of agricultural facilities, and logistical factors (such as space). The site should support electronic communication and have the ability to immediately communicate to Incident Command.

6.3.2 Inspections

When an inspector identifies a conveyance that may be transporting livestock, it should be directed to an animal inspection area where other personnel can determine whether the conveyance has an appropriate permit. Inspectors should collect information, including but not limited to name, contact information, company, vehicle license plate number, origin and destination of cargo, and a copy of any documentation (such as the permit for movement), if needed.

Drivers should be provided with written information providing the reason for the checkpoint, alternate routes around the Control Area (as appropriate), information on obtaining a permit, basic biosecurity requirements, and concise information on the animal health emergency response effort.

All checkpoint personnel should communicate clearly and effectively with drivers, and ensure their interactions are informative and remain respectful. The driver should be provided with an estimate of their delay. For more information on interacting with non-cooperative individuals, see Section 5.3.3.

6.3.3 Cleaning and Disinfection

It may be necessary to conduct cleaning and disinfection activities on conveyances, and ideally there is a cleaning and disinfection station within reasonable distance of a checkpoint. All personnel responsible for the inspection of conveyances must work to mitigate transmission of the disease agent; if the conveyance (including the driver, animal, or piece of equipment within the conveyance) poses an obvious biosecurity risk, it should not be allowed to pass the checkpoint.

6.3.4 Disposition of Conveyances

Ideally, a vehicle will be stopped briefly, have the proper permit documentation, and be allowed to continue. If necessary, personnel may return the conveyances to the point of origin, or to a cleaning and disinfection station. If returned to the premises of origin, the driver should be provided with instructions on how to obtain a permit. Under most circumstances, animals should not be held at a checkpoint; the
conveyance should be returned to the premises of origin (if permitted), or sent to its destination (if it cannot be permitted), or Incident Command will provide further instructions.

6.3.5 Violations

Violations, including failure to have the necessary permit, should be reported to the appropriate officials. Procedures discussed in Section 5.3.1 will generally be followed.

7. Permitting

Permitting in an incident will cover essential movements (or specific permits) from quarantined Infected, Suspect, and Contact premises, commonly allowed movements (or blanket permits) from At-Risk and Monitored Premises out of the Control Area, as well as permits for voluntary COB movements. Permitting is likely to require significant resources and information management capabilities during an outbreak. All permitting with regard to the Federal area quarantine will be overseen by Incident Command; States may also have permitting systems and processes.

Permitting lessens the risk of transmitting the disease agent by considering risk assessments, surveillance information, biosecurity procedures, as well as national and World Organization for Animal Health (OIE) standards. It is essential that personnel responsible for permitting have access to the most recent information about the outbreak, as changes in epidemiological and situational information may change permitting requirements (such as a change in the size of a Control Area, or the designation of a new premises status).

7.1 Processes

It is important to ensure the Incident Command has clear processes for issuing permits for various types of movement (i.e., specific permits, blanket permits, and COB permits), and that this information is clearly communicated to those affected by the disease response effort. It may be necessary to use social media to provide information on permitting processes.

It is essential that Incident Command, through a Permit Team, can efficiently respond to and process permit requests through telephone, email, or other methods. A hotline may be required. Incident Command can also encourage companies to work with those affected to devise alternative arrangements to substitute for movements on to and off of quarantined premises. For example, a customer could perform a meter reading, or mail may be delivered to a safe access point or held at the post office. Certainly there will still be the need for both commonly allowed movements as well as essential movements, even with substitute or short-term measures.

7.2 Documentation

Typically for movements of quarantined animals, for example, to slaughter, a VS Form 1-27 would be required. This form has historically been used for movements of animals from an individually quarantined premises. Instructions for filling out this form are provided here: [http://www.aphis.usda.gov/animal_health/vet_accreditation/nvap_modules/Agency/AGENCY/Assets/VS1-27_1-27Ainst_FINAL.pdf](http://www.aphis.usda.gov/animal_health/vet_accreditation/nvap_modules/Agency/AGENCY/Assets/VS1-27_1-27Ainst_FINAL.pdf). A sample VS Form 1-27 is provided in Appendix G.

For COB and other permitting, other forms may be used. For example, for the Secure Egg Supply Plan, a sample permit is found in Appendix F. Further work on documentation for permitting is needed for movement control and managed movement planning.
7.3 Information Management

For even a medium-sized outbreak, particularly if COB plans are implemented, there will be a significant need for information management systems for permitting. Data collection, management, and analysis capabilities are required.

The USDA’s EMRS 2.0, may be the primary information management system involved in permitting. EMRS 2.0 is currently considered the “system of record” for an animal health emergency response for a Federal area quarantine. As such, permitting—to some extent—will need to be tracked and/or provided by EMRS. This will allow a single system to maintain data that provides the capability to retrieve records of past movement, and filter them based on date, origin, destination, owner, species, and other criteria. Permit denials will also be documented.

At the very least, EMRS will have information about all permits issued by Incident Command, even if the permits themselves are issued by a different information management system. Furthermore, with mobile technology, new resources—that can integrate with the system of record—may be available to facilitate rapid and accurate permitting in an incident.

States may also have information management systems that manage permitting; State plans should consider the implementation of a permit system.

7.4 Vaccinates

For movement of animals that are vaccinated as part of an emergency response effort, consideration must be given to any national or international standards or conditions for such movement.

8. Personnel

8.1 General Responsibilities

Typically, personnel in the Animal Movement and Permits Group will perform QMC activities, though other personnel are likely to be involved. These personnel may be assigned to different types of teams for executing their responsibilities. These personnel will do the following:

- Provide advice and recommendations on
  - planning of premises, area, State, and Federal quarantines,
  - formulation of guidance or requirements for permits and allowable movements, and
  - methods to ensure compliance with the permit system.
- Serve as the first line of communication with owners and agents of animals subject to QMC.
- Collaborate with other authorities involved in QMC activities, such as law enforcement and transportation authorities.
- Tasks, to include
  - enforcing premises quarantine and working with the Biosecurity Group to ensure that biosecurity measures associated with area and premises quarantines are strictly enforced.
  - permitting for allowable movements of animals, animal products, vehicles, equipment, and other materials posing minimal biosecurity risk.
  - staffing quarantine checkpoints to ensure compliance with the permit system.

All personnel involved in QMC responsibilities should learn as much as possible about the procedures discussed in this document and in other resources, including State-specific guidance. Educational sessions and emergency response exercises can also help personnel expand their knowledge.
8.2 Coordination

Personnel/teams responsible for QMC activities will coordinate with other ICS personnel responsible for biosecurity, depopulation, disposal, cleaning and disinfection, wildlife management and vector control, and surveillance. QMC personnel will ensure that personnel have proper authorization to enter quarantined premises for other control and eradication activities, and that they utilize appropriate biosecurity protocols. Additionally, personnel can help to coordinate business activities for producers and service companies, such as delivery services and livestock haulers.

It is important that personnel responsible for QMC activities coordinate closely with those responsible for the welfare and continued care of quarantined animals, as this may necessitate the delivery of feed and other supplies using biosecure methods. Critical movements, such as providing feed for animals, must be given priority in an incident.

Coordination of agencies, authorities and resources is conducted through the Incident Command System. Complex and widespread QMC activities will involve not only the Operations Section, but the Planning Section for support such as situation awareness, the Logistics Section for resources and supplies, Finance/Administration to track costs and human resources, and response personnel assigned to public information and safety.

8.3 Specific Activities

This section provides a brief overview of a number of specific QMC activities that may be conducted in an incident. The extent to which these activities are conducted will vary, depending on the size and scope of the incident, the personnel available, and the decisions of Incident Command. In the event of a large outbreak, particularly of a highly contagious disease such as foot-and-mouth disease, there may be significant resource and logistical limitations that make widespread QMC activities difficult to implement and/or enforce.

8.3.1 Premises Quarantine

Personnel may be assigned to be an on-site presence that notifies premises and animal owners and agents when quarantine is lifted or issued. These personnel or teams are responsible for ensuring compliance with quarantine orders and movement control measures on one or more premises. They will work closely with a Biosecurity Team. Together, these personnel will establish premises biosecurity, develop a list of all people, animals, vehicles, and equipment authorized to enter or leave the property; enforce resultant movement restrictions and biosecurity/cleaning and disinfection protocols, and to ensure that movements on to or off of the premises are authorized. The number of personnel assigned will vary depending on the requirements of the situation and on availability.

8.3.2 Permitting

Personnel may also be assigned to administer the permitting for movement control activities. Permitting will facilitate the biosecure movement of animals, animal products, vehicles, equipment, and other materials without creating an unacceptable risk of disease spread. The number of personnel assigned this responsibility will range depending on need. Permitting activities will include the following:

- Ensuring permit applications are available to the public.
- Responding to permit requests.
- Evaluating permit applications.
- Issuing permits.
- Closing permits.
• Tracking permitted movements.

These personnel will require ready access to epidemiological and biosecurity information so that changes to the permitting criteria can be made as necessary. Permitting requirements may be fluid throughout an incident, particularly as the geographical area of the event expands or contracts.

8.3.2.1 Managing Information

Efficient large-scale permitting activities will require sufficient information management systems, including EMRS 2.0. Documentation of permits and movements should be preserved, tracked, and reviewable. Significant work still needs to be completed on information management systems so that permitting can be efficiently implemented in a widespread disease incident. Personnel will be involved in managing permit information or entering this information into EMRS 2.0.

8.3.3 Checkpoints

Checkpoints may be required depending on the scope of the event. Personnel/teams will staff and supervise a roadside checkpoint, interacting with drivers entering the checkpoint. Checkpoints are intended to ensure compliance with the permit system to allow the permitted movement of animals, animal products, vehicles, equipment, and other materials. Based on authority, checkpoints may be staffed by transportation authorities and local law enforcement officials.

8.4 Waiting Period

Personnel working on the depopulation, cleaning, or disinfection of a quarantined premises must complete a personal disinfection regimen prior to departure from the premises. Additionally, personnel who leave quarantined premises must comply with an appropriate waiting period, as defined by Incident Command. During this time, personnel should not come into contact with any susceptible animal species that are not known to be infected. The waiting period will be based on the disease, the task assignment, and the level of biosecurity required. It is important that personnel understand this condition in order to avoid the actual or perceived transmission of the disease to naïve premises.

8.5 Hazards

All personnel responsible for QMC activities should receive a complete orientation and briefings covering the various hazards that may be encountered. Team members may be assigned to a variety of tasks that could present hazardous situations; site-specific protocols should be developed based on an analysis of these hazards.

8.5.1 Responder Safety

Of primary importance is the personal safety of each responder. This is particularly important if a zoonotic disease is involved. Orientation and briefings should cover specific, necessary safety precautions and hygiene requirements. Responders will face physical and environmental hazards, such as sharp edges, uneven ground or slippery flooring, and extreme temperatures. Those assigned to farms or production facilities are likely to encounter chemical hazards. Personal protective equipment (PPE), which may include outerwear, safety goggles, and respirators, may be required. Apparel may also need to meet transportation industry standards for visibility. The local Department of Transportation can advise on the American National Standards Institute International Safety Equipment Association’s standard for high-visibility safety apparel and headwear (ANSI/ISEA 107-2004).

The Safety Officer ensures safe working conditions for responders and develops the Incident Specific Health and Safety Plan (HASP). For more information on health and safety and PPE, as well as steps to
follow for completing a HASP, please see the *FAD PReP/NAHEMS Guidelines: Health and Safety*, *FAD PReP/NAHEMS Guidelines: PPE*, and the *FAD PReP SOP: Health and Safety/PPE*.

### 8.5.2 Biosecurity

The hazard of spreading disease while implementing QMC activities must be addressed through biosecurity. Response personnel may work in known contaminated areas, may be responsible for evaluating the biosecurity of movements, or may unknowingly come into contact with infected animals at checkpoints. To ensure complete compliance with applicable biosecurity measures, and to properly evaluate movement permit applications, personnel must fully understand pathogen transmission routes.

When movement of people, equipment, vehicles, and other articles is essential, proper decontamination is necessary. The establishment of work zones to enter and leave quarantined premises control access and help prevent contamination of clean areas. Even after thorough personal cleaning and disinfection have been completed, those who leave the premises should not come into contact with susceptible animals for a specified period of time, defined by Incident Command. For more detailed information on biosecurity, the transmission of disease, and work zones, see *FAD PReP/NAHEMS Guidelines: Biosecurity* and *FAD PReP SOP: Biosecurity*.

### 8.6 Training

While this document focuses on QMC from the perspective of APHIS, other agencies may also participate in QMC activities. It is important that personnel from a wide variety of agencies are trained and exercised for these activities, in order to account for personnel turnover, and to develop a robust cadre of trained responders.

Exercises simulate real events in order to evaluate existing plans and identify needed areas of improvement. Potential responders should be encouraged to participate in exercises in order to understand the complex response efforts that will be required. Exercises also help to underscore the need to develop and maintain communication and strong collaborative relationships within the emergency management community, vertically (Federal-State-local), horizontally (interagency), and with industry stakeholders.
ACKNOWLEDGMENTS

The Guidelines: QMC for the Foreign Animal Disease Preparedness and Response Plan/National Animal Health Emergency Management System reflects the efforts of a number of people including USDA APHIS staff members, the Center for Food Security and Public Health at Iowa State University and a wide range of reviewers and subject matter experts. Authors and contributors from the Center for Food Security and Public Health, College of Veterinary Medicine at Iowa State University include:

- Janice P. Mogan, DVM
  Veterinary Specialist

**Glossary**

**Continuity of Business**

The managed movement of non-infected animals and non-contaminated animal products in an FAD outbreak to facilitate agriculture and food industries in maintaining normal business operations while also mitigating the risk of disease spread.

**Hold Order**

A hold order is a temporary order, similar in effect to a quarantine, that is typically implemented while additional diagnostics or investigation is being conducted.

**Movement Control**

Activities used to control the movement of animals, animal products, and fomites in an area subject to certain criteria.

**Permitting**

System that allows entities to make necessary movements without creating an unacceptable risk of disease spread.

**Standstill**

Temporary prohibition of the initiation of any new movement of the susceptible species in a defined area.

**Quarantine**

Imposed restrictions on entering or leaving a premises, area, or region where disease exists or is suspected.

APPENDIX A: THE IMPERATIVE FOR FOREIGN ANIMAL DISEASE PREPAREDNESS AND RESPONSE

Why Foreign Animal Diseases Matter

Preparing for and responding to foreign animal diseases (FADs)—such as highly pathogenic avian influenza (HPAI) and foot-and-mouth disease (FMD)—are critical actions to safeguard the nation’s animal health, food system, public health, environment, and economy. FAD PReP, or the Foreign Animal Disease Preparedness and Response Plan, prepares for such events.

Studies have estimated a likely national welfare loss between $2.3–69 billion\(^3\) for an FMD outbreak in California, depending on delay in diagnosing the disease.\(^4\) The economic impact would result from lost international trade and disrupted interstate trade, as well as from costs directly associated with the eradication effort, such as depopulation, indemnity, carcass disposal, and cleaning and disinfection. In addition, there would be direct and indirect costs related to foregone production, unemployment, and losses in related businesses. The social and psychological impact on owners and growers would be severe. Zoonotic diseases, such as HPAI and Nipah/Hendra may also pose a threat to public health.

Challenges of Responding to an FAD Event

Responding to an FAD event—large or small—may be complex and difficult, challenging all stakeholders involved. Response activities require significant prior preparation. There will be imminent and problematic disruptions to interstate commerce and international trade.

A response effort must have the capability to be rapidly scaled according to the incident. This may involve many resources, personnel, and countermeasures. Not all emergency responders will have specific skills required in areas such as biosecurity, quarantine and movement control, epidemiological investigation, diagnostic testing, depopulation, disposal, or emergency vaccination.

---

Establishing commonly accepted and understood response goals and guidelines, as accomplished by the FAD PReP materials, will help to broaden awareness of accepted objectives as well as potential problems.

**Lessons Learned from Past FAD Outbreaks**

The foundation of FAD PReP is lessons learned in managing past FAD incidents. FAD PReP is based on the following:

- Providing processes for emergency planning that respect local knowledge.
- Integrating State-Federal-Tribal-industry planning processes.
- Ensuring that there are clearly defined, obtainable, and unified goals for response.
- Having a Unified Command with a proper delegation of authority that is able to act with speed and certainty.
- Employing science- and risk-based management approaches to FAD response.
- Ensuring that all guidelines, strategies, and procedures are communicated effectively to responders and stakeholders.
- Identifying resources and trained personnel required for an effective incident response.
- Trying to resolve competing interests prior to an outbreak and addressing them quickly during an outbreak.
- Achieving rapid FAD detection and tracing.

**FAD PReP Mission and Goals**

The mission of FAD PReP is to raise awareness, expectations, and develop capabilities surrounding FAD preparedness and response. The goal of FAD PReP is to integrate, synchronize, and deconflict preparedness and response capabilities as much as possible before an outbreak by providing goals, guidelines, strategies, and procedures that are clear, comprehensive, easily readable, easily updated, and that comply with the National Incident Management System.

In the event of an FAD outbreak, the three key response goals are to: (1) detect, control, and contain the FAD in animals as quickly as possible; (2) eradicate the FAD using strategies that seek to stabilize animal agriculture, the food supply, the economy, and to protect public health and the environment; and (3) provide science- and risk-based approaches and systems to facilitate continuity of business for non-infected animals and non-contaminated animal products. Achieving these three goals will allow individual livestock facilities, States, Tribes, regions, and industries to resume normal production as quickly as possible. They will also allow the United States to regain FAD-free status without the response effort causing more disruption and damage than the disease outbreak itself.

**FAD PReP Documents and Materials**

FAD PReP is not just one, standalone FAD plan. Instead, it is a comprehensive U.S. preparedness and response strategy for FAD threats, both zoonotic and non-zoonotic. The following section provides examples of the different types of FAD PReP documents available.

- Strategic Plans—Concept of Operations
  - *APHIS Foreign Animal Disease Framework: Roles and Coordination* (FAD PReP Manual 1-0): This document provides an overall concept of operations for FAD preparedness and response for APHIS, explaining the framework of existing
approaches, systems, and relationships.

- **APHIS Foreign Animal Disease Framework: Response Strategies** (FAD PReP Manual 2-0): This document provides significant detail on response strategies that will be conducted in an FAD outbreak.

- **FAD Investigation Manual** (FAD PReP Manual 4-0): This field-ready manual provides detailed information on completing an FAD investigation from start to finish.

- **A Partial List of FAD Stakeholders** (FAD PReP Manual 5-0): This guide identifies key stakeholders with whom the National Preparedness and Incident Coordination Center collaborates.

- **Incident Coordination Group Plan**: This document explains how APHIS headquarters will organize in the event of an animal health emergency.

- **NAHEMS Guidelines**
  - These documents describe many of the critical preparedness and response activities, and can be considered as a competent veterinary authority for responders, planners, and policy-makers.

- **Industry Manuals**
  - These manuals describe the complexity of industry to emergency planners and responders and provide industry a window into emergency response.

- **Disease Response Plans**
  - Response plans are intended to provide disease-specific information about response strategies. They offer guidance to all stakeholders on capabilities and critical activities that would be required to respond to an FAD outbreak.

- **Standard Operating Procedures (SOPs) for Critical Activities**
  - For planners and responders, these SOPs provide details for conducting critical activities such as disposal, depopulation, cleaning and disinfection, and biosecurity that are essential to effective preparedness and response to an FAD outbreak. These SOPs provide operational details that are not discussed in depth in strategy documents or disease-specific response plans.

- **Continuity of Business Plans** (commodity specific plans developed by public-private-academic partnerships)
  - Known as the Secure Food Supply Plans, these materials use science- and risk-based information to facilitate market continuity for specific products in an outbreak.
  - More information on these plans can be found at the following: [www.secureeggsupply.com](http://www.secureeggsupply.com), [www.securepork.org](http://www.securepork.org), [www.securemilksupply.org](http://www.securemilksupply.org), [www.securebroilersupply.com](http://www.securebroilersupply.com).

- **APHIS Emergency Management**
  - **APHIS Directives and Veterinary Services (VS) Memorandums** provide important emergency management policy. These documents provide guidance on topics ranging from emergency mobilization, to FAD investigations, to protecting personnel from HPAI.

APPENDIX C: EXAMPLE OF QUARANTINE NOTICE

First, this appendix provides an example of a Federal order to expand the quarantined area during a disease outbreak. Second, it provides an example “Notice of Quarantine” from a State. State notices will vary based on State authority.

NOTICE OF QUARANTINE

STATE OF RHODE ISLAND AND PROVIDENCE PLANTATIONS
DEPARTMENT OF ENVIRONMENTAL MANAGEMENT

ESTABLISHMENT OF A QUARANTINE RELATING TO [BOTANICAL OR ZOOLOGICAL TAXON, COMMON NAME] IN THE STATE OF RHODE ISLAND

Pursuant to the authority vested in the RHODE ISLAND DEPARTMENT OF ENVIRONMENTAL MANAGEMENT by Rhode Island General Laws (RIGL) § 2-16-3(3), 1, [Name of DAG Chief], in my capacity as Chief of the Division of Agriculture, Department of Environmental Management ("DEM"), pronounce and declare that [botanical or zoological taxon], also known as "[common name]," constitutes a "plant pest" as defined by RIGL § 2-16-2(2)(A). I further find that the presence of [botanical or zoological taxon] in the State of Rhode Island would present an imminent threat to the agricultural industry, general environment, and public welfare of the state.

Based upon information provided to DEM by the United States Department of Agriculture ("USDA"), one or more shipments of [kind of plants that are at-risk] from the [name of supplier] in [location of supplier] have been traced to establishments in Rhode Island. The USDA has identified these plants as part of a shipment that originated in [country of origin] and that have tested positive for [botanical or zoological taxon]. The discovery of [botanical or zoological taxon] in plants connected with this shipment has already necessitated the [remedial action, such as destruction of greenhouse stock] in [states].

Accordingly, pursuant to the authority of RIGL §2-16-3(5) and §2-16-10, I hereby establish a temporary quarantine of the following premises:

[Name, address of premises]

Locations at these premises have been identified as containing plants that are part of or that have come into contact with the suspect shipments. No plants, plant parts, or related articles shall be moved from any greenhouse, field, or surrounding area, as determined by the Chief, that contains plants, plant parts, or related material originating from a source or location where [botanical or zoological taxon] is known to be present, unless it is determined by the Chief that the movement of such articles does not constitute a risk of spreading [botanical or zoological taxon] within the State. I find that it is necessary to establish this quarantine on a temporary basis without prior notice or hearing, as permitted by RIGL § 2-16-10, in order to effectively prevent or retard the spread of [botanical or zoological taxon] into other premises or communities to the detriment of the welfare of the agricultural economy of the State.

This quarantine shall be effective for a period of thirty (30) days, through and including [date that is 30 days from the beginning of the quarantine]. During this period, the Premises and the plants therein shall be subject to inspection and testing for the presence of [botanical or zoological taxon]. During this thirty (30) day period a public hearing shall be advertised and held for the purpose of discussing the continuation and maintenance of said quarantine beyond the thirty (30) day period.

WHEREFORE, in order to protect the agricultural industry, general environment, and public welfare, I find that the attached quarantine shall become effective immediately. Notice of the date, time and place of a public hearing within thirty (30) shall be advertised in accordance with RIGL § 2-16-10.

Consistent with the provisions of RIGL § 20-16-11, a penalty of up to two hundred dollars ($200) per violation of the quarantine, may be imposed.

Signed this [number, 1st to 31st] day of [month, year].

[Name of DAG Chief], Chief, Division of Agriculture, RI DEM
APPENDIX D: FOOT-AND-MOUTH DISEASE RESPONSE QUARANTINE, MOVEMENT CONTROL, AND CONTINUITY OF BUSINESS READY REFERENCE GUIDE

This appendix contains the Foot-and-Mouth Disease Response Ready Reference Guide for Quarantine, Movement Control, and Continuity of Business. For those with access to the APHIS intranet, this document is available on the internal APHIS FAD PReP website: http://inside.aphis.usda.gov/vs/em/fadprep.shtml. It is also available publicly: http://www.aphis.usda.gov/fadprep.
In an FMD outbreak, quarantine, movement control, and continuity of business (managed movement) help to achieve the goals of an FMD response. In particular, these critical activities work to control and contain FMD, striving to eradicate the virus while providing science- and risk-based approaches to facilitate the movement of non-infected animals and non-contaminated animal products to stabilize animal agriculture, the food supply, the economy, and protect public health.

**Quarantine and Movement Control in an FMD Outbreak**

In an FMD outbreak, quarantine and movement control are critical activities for an effective FMD response effort. By restricting the movement of infected animals, animal products, and contaminated fomites, quarantine and movement control play a significant role in stopping the spread of FMD. Quarantines will be implemented for Infected, Suspect, and Contact Premises. Movement controls will be implemented for At-Risk and Monitored Premises within a Control Area.

**Continuity of Business (Managed Movement) in an FMD Outbreak**

Continuity of business is the management of non-infected premises, non-infected animals, and non-contaminated animal products in an FMD outbreak. This helps to facilitate agriculture and food industries in maintaining business operations, while also mitigating the risk of disease spread. Continuity of business planning can

- protect animal health by preventing the transmission of FMD from an infected to a naive animal subpopulation,
- protect food security by facilitating the movement of food products to processing, and
- help to mitigate the impact of quarantines on non-infected premises in regulatory Control Areas.

**How Does Continuity of Business Work with Quarantine and Movement Control?**

Quarantine, movement control, and continuity of business have the same ultimate goal: to prevent the transmission of FMD to non-infected premises, particularly those outside the Control Area. While quarantine and movement restrictions are highly effective at limiting the spread of disease, they also impede typical business operations—this is when continuity of business plans enter into response efforts to effectively manage movement.

- **Quarantines and movement controls** are applied to premises in a regulatory Control Area to ensure infected animals and contaminated fomites and products do not leave premises. Quarantines are applied to Infected, Contact, and Suspect Premises. Movement controls are applied to At-Risk and Monitored Premises. Consideration will be given to critical movements (i.e., feed trucks).
- **Continuity of business or managed movement** is intended to manage movement for the non-infected premises (At-Risk and Monitored Premises).

**Implementation of Quarantine, Movement Control, and Continuity of Business in an FMD Outbreak**

Immediately after FMD detection, a regulatory Control Area, comprised of an Infected and Buffer Zone, will be designated. Quarantines will be implemented for Infected, Contact, and Suspect Premises in this regulatory Control Area. Continuity of business plans—ideally developed in advance—will be implemented to facilitate the managed movement of commodities and animals from At-Risk and Monitored Premises existing within this regulatory Control Area, helping these industries continue business operations. At all times, consideration will be given to critical movements, like feed trucks.

In an FMD outbreak, a Unified Command would be established to manage the incident. The animal health emergency response plan of every State and Tribal Nation should describe the implementation of quarantine and movement controls, including a permit system. USDA may also impose a Federal quarantine for the management of interstate commerce from infected States.

**FMD-Specific Challenges**

The FMD virus is highly contagious and can spread easily through fomite movement. In addition, an outbreak of FMD would have significant economic implications in terms of interstate trade and international commerce. The capabilities required to respond to an FMD outbreak are extensive. Any response effort, whether the outbreak is large or small, will require significant operational capabilities.

**Critical Activities and Tools**

In addition to quarantine and movement control and continuity of business, other critical activities will be implemented in an FMD outbreak to contain, control, and eradicate the virus. These include

- public awareness campaign,
- epidemiological investigation and tracing,
- rapid diagnosis and reporting,

- increased surveillance,
- biosecurity measures,
- cleaning and disinfection,
- appropriate disposal procedures,
- mass depopulation and euthanasia (as response strategy indicates), and
- emergency vaccination (as response strategy indicates).
Continuity of Business Is a Public, Private, Academic Partnership

Continuity of business planning requires the active collaboration, communication, and coordination of public officials, private industry, and academia/extension experts. Prior to an outbreak, these groups work together to develop the processes by which non-infected premises can move non-infected animals and non-contaminated animal products. Collaboratively, proactive risk assessments will be used to develop the requirements for movement of commodities out of a regulatory Control Area. These requirements can include biosecurity measures, cleaning and disinfection procedures, and surveillance sampling prior to movement. With the backing of regulators, the support of industry, and the expertise of academia, the development of continuity of business plans is a critical activity in effective FMD preparedness and response.

Preparedness and Response Goals for Continuity of Business

- Provide science- and risk-based approaches and systems for the continuity of business involving non-infected animals and non-contaminated animal products.
- Establish a transparent and effective system for risk assessments, surveillance requirements, biosecurity procedures, and a permit process in order to promote stakeholder acceptance and compliance with regulatory interventions by State, Federal, and Tribal authorities.
- Work with industry stakeholders and experts to prioritize animal or commodity movements that have the potential to be affected by disease or disease response.
- Perform proactive risk analysis or risk assessments for the movement of animals and/or animal commodities that are potentially disrupted or affected by a disease response.
- Implement an appropriate continuity of business plan for industries or industry segments being addressed.

What Are Key Elements of Continuity of Business Plans for Managed Movement?

Continuity of business plans will vary, depending on the industry and specific commodity of interest. However, a number of common elements will appear, some of which are listed here:

- **Risk assessments:** Proactive risk assessments can help determine the disease transmission risk of specific product movements.
- **Surveillance requirements:** How frequently samples will be collected, from what populations, and for how long.
- **Biosecurity guidelines:** Appropriate precautions, personal protective equipment, and specific steps for various fomites and equipment.
- **Cleaning and disinfection procedures:** Cleaning requirements for various fomites and equipment, including information on appropriate disinfectants.
- **Epidemiological information:** Information on routine and non-routine movements to and from premises, as well as information on the number of animals, species, and age of animals.
- **Permitting guidance:** Transparent, explicit guidance for Incident Command regarding movement requirements for various commodities.

What Are the Current Continuity of Business Planning Initiatives for FMD?

There are a number of successful efforts underway where the government, private sector, and academia are collaborating to improve continuity of business planning for an FMD outbreak. Current planning initiatives include the:

- **Secure Milk Supply:** In progress. Goal of planning is to avoid and mitigate interruptions in raw milk movement from dairy farms to processing during an FMD outbreak.
- **Secure Pork Supply:** In progress. Goal of planning is to avoid and mitigate interruptions in the movement of pork and pork products during an FMD outbreak.

Please see the Overview of the Secure Food Supply Plans Ready Reference Guide for more information on these and other projects.
Overview

The previous page highlights the importance of quarantine and movement control measures and continuity of business (managed movement) plans in the event of an FMD outbreak to contain, control, and eradicate FMD while stabilizing animal agriculture, the food supply, the economy, and protecting public health. The maps on this page provide a common picture of livestock densities and distributions to understand the potential impact of quarantines, movement controls, and the imperative for continuity of business planning. The degree of interstate commerce and international trade in the United States (continued on the next page) means that an FMD outbreak would have a significant economic impact as movement of animals (and products) slows dramatically or even halts, particularly in the beginning of an outbreak.

Imports from Canada: Dairy, Red Meat Products ~$664 Million
Exports to Canada: Dairy, Red Meat Products ~$2.8 Billion

Imports from Mexico: Dairy, Red Meat Products ~$2 Billion
Exports to Mexico: Dairy, Red Meat Products ~$3.2 Billion

Control Areas in an FMD Outbreak (Small and Medium)

There are many different factors that will be considered in determining the size of a Control Area. Smaller Control Areas may mean that fewer premises and animals are affected by quarantines and movement controls, however, if premises or animals are infected but undetected, there is a higher chance they may exist outside the Control Area (increasing the risk of disease spread).

**Small Control Areas**
- Affected: ~5.7 million livestock
- ~4,700 operations

**Medium Control Areas**
- Affected: ~17.8 million livestock
- ~34,000 operations

Control Areas in an FMD Outbreak (Large)

There are many different factors that will be considered in determining the size of a Control Area. Large Control Areas may mean that many more premises and animals are affected by quarantines and movement controls, however, if premises or animals are infected but undetected, it is likely that they may exist within the Control Area rather than outside of it, limiting the spread of disease.

<table>
<thead>
<tr>
<th>Zone or Area</th>
<th>Minimum Size and Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infected Zone (IZ)</td>
<td>Perimeter should be at least 3 km (~1.86 miles) beyond perimeters of presumptive or confirmed Infected Premises. Will depend on disease agent and epidemiological circumstances. This zone may be redefined as the outbreak continues.</td>
</tr>
<tr>
<td>Buffer Zone (BZ)</td>
<td>Perimeter should be at least 7 km (~4.35 miles) beyond the perimeter of the Infected Zone. Width is generally not less than the minimum radius of the associated Infected Zone, but may be much larger. This zone may be redefined as the outbreak continues.</td>
</tr>
<tr>
<td>Control Area (CA)</td>
<td>Perimeter should be at least 10 km (~6.21 miles) beyond the perimeter of the closest Infected Premises. This area may be redefined as the outbreak continues.</td>
</tr>
<tr>
<td>Surveillance Zone (SZ)</td>
<td>Width should be at least 10 km (~6.21 miles), but may be much larger.</td>
</tr>
</tbody>
</table>

Large Control Areas

Affected:

~33.7 million livestock
~290,000 operations

Regulatory Control Areas: Examples of the Upsides and Downsides to Large and Small Control Areas

<table>
<thead>
<tr>
<th>Small Control Area</th>
<th>Large Control Area</th>

APPENDIX E: CURRENT SECURE FOOD SUPPLY PLANS

The Secure Food Supply Plans are public-private-academic partnerships. The goals of the Secure Food Supply projects are to (1) avoid interruptions in animal/animal product movement to commercial processing from premises with no evidence of infection in an FAD outbreak, (2) provide a continuous supply of wholesome food to consumers, and (3) maintain business continuity for producers, transporters, and food processors through planning for an FAD response.

Current collaborations and Secure Food Supply projects include the following (please see Table E-1 for further information):

- Secure Milk Supply (SMS) Plan: http://www.securemilksupply.org/
  - National Working Groups:
    - Biosecurity
    - Movement Plans
    - Risk Assessment.
  - State/Regional SMS Projects: http://securemilksupply.org/state-regional.php
    - Colorado SMS
    - California SMS
    - Mid-Atlantic SMS (DE, MD, NC, NJ, PA, SC, TN, VA, WV)
    - New England SMS (CT, MA, ME, NH, RI, VT)
    - Oregon, Washington SMS
    - Wisconsin SMS.
- Secure Turkey Supply (STS)
- Secure Pork Supply (SPS): http://securepork.org/

Key academic contributors to COB projects include the

- Center for Food Security and Public Health (CFSPH), Iowa State University;
- Center for Animal Health and Food Safety (CAHFS), University of Minnesota;
- University of California, Davis, Department of Veterinary Medicine and Epidemiology; and
- National Center for Foreign Animal and Zoonotic Disease Defense, Texas A&M University (FAZD).

APPENDIX F: EXAMPLE MOVEMENT PERMITS

This appendix contains various movement permits for movement controls and managed movements that may be used in a disease incident. To date, there is not a template for permits; permits may vary by Secure Food Supply Plan or jurisdiction. It is at the discretion of Incident Command to accept or provide conditions for permits in an incident.

---

INITIAL PERMIT FOR MOVEMENT OF WASHED AND SANITIZED SHELL EGGS TO PREMISES WITH Poultry (OTHER THAN DIRECTLY TO MARKET)

PERMIT NUMBER: XX.0  DATE OF PERMIT:  

*XX is premises number, initial permits will be numbered zero and subsequent permits 1, 2, 3 and so on.

Shipment is permitted from ______________(farm name) to ______________(premises with poultry).

- The cargo interior and exterior of the transport vehicle must be cleaned and disinfected. The driver will not be allowed outside the cab or else the cab interior must also be cleaned and disinfected. The truck's tires and wheel wells must be cleaned and disinfected when leaving premises within the Control Area.

- Transport vehicle must be sealed by farm or company personnel under authorization of Incident Commander.

SEAL #:    

- Egg handling material used to transport eggs to breaking or further processing plants must be destroyed at the final destination or cleaned, sanitized (following accepted procedures) and returned to the premises of origin without contacting materials going to other premises.

- This permit is only valid if accompanied by a negative RRT-PCR test for HPAI conducted on a pooled sample of oropharyngeal swabs from 5 dead birds out of every 50 dead birds from each house on the premises. (The test must be conducted by a National Animal Health Laboratory Network laboratory.)

Date of negative RRT-PCR test for HPAI: ______________ (This permit allows movement of eggs until the next day's RRT-PCR test results are available).

This permit is valid ONLY if a copy of the current negative RRT-PCR test results for this flock is attached.

I certify that the flock of origin of the washed and sanitized shell eggs has met the permit criteria as stated in the SES Plan.

/ Incient Commander  Printed Name and Signature  Date (mm/dd/yyyy)

I certify that the production parameters for the flock of origin of the washed and sanitized shell eggs are within normal range today.

/ Farm Manager  Printed Name and Signature  Date of shipment (mm/dd/yyyy)

The Incident Command Post (ICP) may issue the initial permit as soon as negative RRT-PCR test results have been received if the premises is compliant with the permit guidance. Subsequent permits for movement of this product may be issued by the farm manager unless a significant change in production parameters occurs, the flock is found to have a positive RRT-PCR result for HPAI, or some other significant event occurs such as the onset of obvious clinical signs of HPAI or a determination is made that the flock is a Contact Premises. On an ongoing basis, the ICP will monitor RRT-PCR results from each flock and will review flock production parameters to confirm the flock continues to be eligible for this permit.

Draft May 2012  Form Revision Date:
