NAHMS Dairy 2014 Study

In January 2014, the USDA’s National Animal Health Monitoring System (NAHMS) will launch its sixth national dairy study. Dairy 2014 will take an in-depth look at U.S. dairy operations, and provide the industry with new and valuable information regarding trends in the dairy industry from 1991 to 2014.

Study focus

For the study, NAHMS asked dairy producers, industry stakeholders, and government officials to provide input and define the information needs of the dairy industry. During this process, six study objectives were identified:

- Describe trends in dairy cattle health and management practices.
- Describe management practices and production measures related to animal welfare.
- Estimate the prevalence of lameness, and evaluate housing and management factors associated with lameness.
- Evaluate calf health from birth to weaning.
- Describe antibiotic use and residue prevention methods used to ensure milk and meat quality.
- Estimate the prevalence and antimicrobial resistance patterns of select foodborne pathogens.

What your participation involves

In January 2014, representatives from the USDA’s National Agricultural Statistics Service (NASS) will contact selected producers in 17 States. NASS representatives will conduct personal interviews with all participating operations with 30 or more cows. NASS will mail a brief questionnaire to all other participating operations (fewer than 30 cows). Operations that do not respond to the mail-in questionnaire by the deadline will be contacted via telephone by NASS representatives, who will complete the questionnaire at that time.

For operations that are eligible and choose to continue in the study:

- Representatives from USDA’s Veterinary Services will visit from March to May 2014 to administer a second questionnaire, perform a lameness evaluation, and collect milk and fecal samples.
- A subset of these operations will have the opportunity to participate in a year-long calf-monitoring study.

“Our dairy farm participated in the last NAHMS dairy study and I was amazed at the data that was generated. I would urge all dairy producers to participate.”

—Velmar Green, dairy producer
Green Meadow Farms
Benefits of the Dairy 2014 study

Participating producers will receive:

- Customized reports describing animal welfare measures, heifer-calf growth and productivity, the risks of drug residues in meat and milk, and how to address these risks. Based on questionnaire responses, these reports will allow producers to compare their practices and productivity measures with those of other dairies. Best management practices/industry goals will also be included.
- The opportunity to improve the health and productivity of heifer calves, from birth to weaning.
- Reports and information sheets.

The dairy industry will benefit from:

- Current and scientifically valid estimates of management practices, disease prevalence, and other information important for trade and the health of the dairy industry (e.g., benchmarking).
- Trends in the implementation of management practices and the prevalence of foodborne pathogens.

A scientific approach

NAHMS collects and reports accurate and useful information on animal health and management in the United States. Since 1990, NAHMS has developed national estimates on disease prevalence and other factors related to the health of U.S. beef cattle, sheep, goat, dairy cattle, swine, equine, poultry, and catfish populations. The science-based results produced by NAHMS have proven to be of considerable value to the U.S. livestock, poultry, and aquaculture industries, as well as other animal health stakeholders.

NAHMS studies are
- National in scope
- Science based
- Statistically valid
- Collaborative
- Voluntary
- Anonymous

Privacy

Because NAHMS studies rely on voluntary participation, the privacy of every participant is protected. Only those collecting the data know the identity of the respondent. No name or contact information will be associated with individual data, and no data will be reported in a way that could reveal the identity of a participant. Data are presented only in an aggregate manner.
