CERTIFICATION BY HEADQUARTERS RESEARCH FACILITY OFFICIAL  
 ( Chief Executive Officer or Legally Responsible Institutional Official )

SIGNATURE OF C.E.O. OR INSTITUTIONAL OFFICIAL	NAME & TITLE OF C.E.O. OR INSTITUTIONAL OFFICIAL	DATE SIGNED  11/18/07
---	--	-----------------------------

Protocol 16841 (old protocol 18), 16283, and 16285 – The PI requested and the IACUC approved a permanent exemption to the USDA requirement for an elevated perch in the cat's cage following spinal transection surgery. Spinalized cats cannot reach an elevated perch, so the devices are not useful in this population. Additionally such devices may result in injury to the animal should it become entrapped. Padded flooring is provided for the animal in the cage. A total of 5 cats were covered by this exemption.

Protocol 16941 – The PI requested permission to perform major survival surgery in a laboratory (Room 8312 NCB) in order to implant chronic stable electrodes in the brain of rabbits. This laboratory is equipped with a state of the art microelectrode recording system that can be used to properly place electrodes during surgery thus confirming that the electrode is in the correct position and able to record cells in that area. This system contains precision instruments that have been configured to operate in room 8312, and thus cannot be transported to the operating suite. The IACUC inspected this room prior to the first surgery and at least every 6 months and found it appropriate for conducting survival surgery. A total of 22 rabbits were covered by this exemption.

Form 7023 Attachement

November 21, 2007

Dear Dr. Goldentyer:

Please note that we experienced the birth of (1) Capuchin on January 24, 2007. This primate was not used in research and is listed in column B of our annual report.

We also experienced the death of a Capuchin in September, 2007. This primate was used in research prior to his death.

The total number of primates at our facility during the reporting period was 21.

### Summary of Exceptions to Welfare Regulations

1. One hundred and twenty Siberian (aka Djungarian) hamsters (*Phodopus sungorus*) will be housed in a temperature-controlled chamber for studies of torpor use and dietary lipid choice in cold situations. They will be held at temperatures no lower than 5 °C and no higher than 30 °C. The hamsters will be properly housed in every other way and provided cotton as a nesting material for additional floor insulation. Although page 73 (§3.26) of the Animal Welfare Regulations states, "The ambient temperature shall not be allowed to fall below 60°C nor exceed 85 °C", Siberian hamsters commonly experience much lower winter temperatures in the wild, therefore animals are naturally accustomed to such conditions. In IACUC-approved published studies using temperatures designed to fall within the range experienced by this species in nature, furless Siberian hamsters have been successfully held at 5 °C without cotton bedding for 5 weeks (e.g., Kauffman et al. 2001). To eliminate problems occasionally associated with large changes in ambient temperature, treatments will be timed so that hamsters never experience a temperature change of more than 10 °C per day. Because the use of torpor and the influence of low ambient temperature on diet choice can be studied only at lower temperatures than those maintained in the regular animal housing, the IACUC has approved this use of the controlled temperature chamber.

Kauffman AS, Cabrera A and Zucker I. 2001. Torpor characteristics and energy requirements of furless Siberian hamsters. *Physiol. Biochem. Zool.* 74:876-884.

2. In studies of circadian rhythms, endogenous rhythms are discovered by housing animals in constant conditions of light or dark cycles. Siberian hamsters are kept in constant darkness during the time period required for observing the free-running circadian rhythm, which is the rhythm exhibited when there are no clues to the actual 24-hour day/night cycle. This is a standard procedure that has been used to investigate circadian rhythms in nocturnal rodents since the 1960's (e.g., Aschoff 1960) and continues to be in common use today (e.g., Hofstetter et al. 2005). A maximum of one hundred and twenty animals will be used. The IACUC has approved housing Siberian hamsters in constant darkness for experiments concerning circadian rhythms.

Aschoff J. 1960. Exogenous and endogenous components in circadian rhythms. *Cold Spr Harbor Symp Quant Biol* 25:11-28.

Hofstetter JR, Hofstetter AR, Hughes AM and Mayeda AR. 2005. Intermittent long-wavelength red light increases the period of daily locomotor activity in mice. *J Circad Rhythms* 3:8.

## Summary of Exceptions to Welfare Regulations Continued

3. Page 75 (§3.29(d) Feeding.) of the Animal Welfare Act and Animal Welfare Regulations states that "All food receptacles shall be kept clean and shall be sanitized at least once every 2 weeks". On average, approximately 260 Siberian hamsters (*Phodopus sungorus*) will be used each year as subjects for experiments involving dietary manipulations. In many cases, hamsters are given a choice between 2 food options. Hamster chow 'pellets' are coated or flavored with the experimental substance and are later counted and weighed in order to determine preference and intake. Allowing the cage tops or food receptacles to remain untouched during the experimental period will eliminate the chance of food pellets being mixed between divided hopper compartments as well as prevent any pellets from mistakenly being discarded. Research studies will run anywhere between 2-12 weeks. Under any circumstance in which the food in the hoppers may become moldy or deteriorated, or hoppers become caked with decaying food, the cage tops will be changed and sanitized immediately. Cage tops will be changed and sanitized at the conclusion and start of each experiment. The IACUC has approved changing cage tops in between experiments.

October 29, 2007.

CERTIFICATION BY HEADQUARTERS RESEARCH FACILITY OFFICIAL  
( Officer or Legally Responsible Institutional Official )

DATE SIGNED  
1/7/08

**The IACUC has approved protocols that require multiple survival surgeries:**

**Procedure for monitoring these activities:**

Veterinary Technicians check on all of the animals every day in the Laboratory Animal Facility (LAF). All LAF staff monitor animals during the course of their daily activities and any animals in need of care are brought to the attention of the Attending Veterinarian and/or the Veterinary Technicians. Monitoring plans are developed on a protocol-by-protocol basis.

***Protocols approved for multiple survival surgeries:***

- a) A protocol is approved to study in utero bone marrow transplantation and postnatal engraftment enhancement techniques in a canine model (06-707). At gestational day 37, fetuses undergo in utero bone marrow transplant. Between one and six months of age, some of these animals undergo skin grafting to assess immune tolerance. In a different aim, similar studies involve bone marrow transplant at gestational day 37, and between one and six months of age these animals receive a second bone marrow transplant. The IACUC also approved performing the in utero bone marrow transplant as described and if necessary, for medical reasons, performing a C-section to protect the bitch or the fetus.
- b) A protocol is approved to establish an in vivo model of subglottic stenosis to determine the effects of cytokine manipulation on subglottic scarring in a rabbit model (04-717). A section of the trachea is resected to a subcutaneous pocket. Four weeks after the engraftment, a small incision is made and the tracheal tissue is evaluated with an endoscope and in some animals the tissue is injured. One week later a small incision is made and the injured tissue is treated with an adenoviral vector encoding a potentially therapeutic gene, a control vector, or vehicle. Six weeks later the tracheal transplant is evaluated by endoscopy in a terminal anesthetic procedure and the tissue harvested for histopathologic evaluation. **This protocol was terminated by the investigator on 11/13/06. No animals were used for this reporting period.**
- c) A protocol is approved to determine the degree and manner in which relief of pulmonary artery stenosis affects the amount of pulmonary valve leakage/insufficiency in a swine model (05-736). Two groups of animals are studied. One group undergoes surgical creation of pulmonary insufficiency (PI group). The second group undergoes surgical creation of pulmonary insufficiency as well as creation of left pulmonary artery stenosis (PI/PAS group). In the second group, left pulmonary artery stenosis is created to simulate the branch pulmonary artery stenosis seen in repaired tetralogy of Fallot. Following this surgical stage, pulmonary regurgitant fraction is measured in both groups using MRI techniques. Both groups undergo cardiac catheterization.
- d) A protocol is approved to develop a rabbit model of subglottic stenosis (06-768). Surgery is performed to strip laryngeal mucosa from the cartilage of the cricoid. The perichondrium and superficial cartilage are removed with a surgical drill. A subset of animals undergo a second surgery on Day 7 to deliver an adenoviral vector

engineered to express potentially therapeutic genes. **This protocol was terminated by the investigator on 5/28/07. No animals were used for this reporting period.**

- e) A protocol is approved to determine if delivery of the iNOS gene via gene-coated stent can be used to prevent the development of in-stent restenosis by eliminating neo-intimal proliferation within stented pulmonary arteries in a swine model (06-788). Initially an animal model of proximal left pulmonary artery stenosis and pulmonary valve insufficiency is created. Six weeks later, each animal undergoes a cardiac catheterization to deploy a gene-coated stent into the stenotic pulmonary artery. One month following stent placement, the animals undergo a second cardiac catheterization to evaluate for in-stent restenosis.
- f) A protocol is approved to determine if non-surgical implantation of a pulmonary valve within the proximal right and left branch pulmonary arteries is effective at reducing pulmonary valve insufficiency in a swine model (06-789). Initially an animal model of postoperative pulmonary insufficiency and branch pulmonary artery stenosis is created. Two months following the surgery, the animals undergo cardiac catheterization with placement of a surgically created “valved-stent” into both the proximal right and left pulmonary arteries. One week following placement of the valved-stents, the animals undergo a second catheterization to evaluate the short term functionality of the valved-stents.

**Food or Fluid Restriction**

Experimental situations that require food and/or fluid restriction:

Title of Experiment	Justification	Species	Length of Restriction
1. Cardiac Valvuloplasty in Fetal Sheep (05-604) 2. Pharmacological Treatment of Pulmonary Hypertension (05-741) 3. Post-Infarction Ventricular Remodeling in Fetal Sheep (07-803)	Prevention of vomiting and aspiration of stomach contents during anesthetic induction of pregnant sheep.	Sheep	Food withheld for 24-48 hours prior to surgery with unrestricted access to water.

→ **Number of Sheep Affected for this Reporting Period: 10**  
**(1 was fasted for 24 hours; 9 were fasted for 48 hours)**

*Variables that are monitored to ensure animal health during the restricted period.*  
 When sheep are fasted for 24-48 hours, a form is placed on the cage where urine/fecal output is noted daily. If a decrease in fecal or urine output is noted, a Veterinary Technician is notified.

*Steps taken to ensure adequate nutrition/hydration during the restricted period.*  
 The sheep are allowed free access to water at all times. We have not observed detrimental effects in the sheep from food restriction, and have a low rate of complications with survival sheep fetal surgeries.

**ASSURANCE STATEMENTS**

- 1) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual res teaching, testing, surgery, or experimentation were followed by this research facility.
- 2) Each principal investigator has considered alternatives to painful procedures.
- 3) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and ap Institutional Animal Care and Use Committee (IACUC). **A summary of all such exceptions is attached to this annual report.** In addition to identifying the IACUC-approved exceptions, this summary inc brief explanation of the exceptions, as well as the species and number of animals affected.
- 4) The attending veterinarian for this research facility has appropriate authority to ensure the provision of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

## ANNUAL REPORT OF RESEARCH FACILITY, continuation

### 3. Reporting facilities

Animal Behavior Lab (formerly Psychology Lab, west of Route 15 in Bucknell West)  
Biology/Psychology animal facility (in basement of Biology Building on main campus)

### IACUC approved exceptions to standards and regulations

#### 1. Exception to regulation discouraging multiple surgeries

Hamsters serving as subjects in studies of the neural and neuroendocrine control of reproductive behavior often will undergo gonadectomy followed by brain surgery, the latter involving the placement of a lesion or the implantation of the guide cannula required for intracranial drug administration. Both procedures are central to our goals and experimental designs, both of which which revolve around the observation of responses to brain manipulations (requiring the brain surgery) in animals with controlled levels of gonadal hormones (requiring the gonadectomy). The rationale for separating these procedures (leading to multiple surgeries) is two-fold. First, we are convinced that a sequence of surgical procedures involves less stress and trauma than a single operation including both of the necessary procedures. Second, some of the behaviors of interest exhibit large individual differences, with the potential to obscure treatment effects. In such situations, it often is useful to use a within-subjects experimental design, in which any negative impact of individual differences is reduced by using each subject as its own control. In many of our studies, however, this requires that a subject be gonadectomized (so as to bring hormone levels under control), then undergo an initial round of behavioral testing (to establish baseline levels of behavior), then receive a brain lesion or control treatment, then undergo additional behavioral testing (to measure the treatment's impact). Such designs obviously require multiple surgeries. The number of animals that will be affected by this exception in 2007-08 will be approximately 35.

#### 2. Exception to regulation requiring that bats be housed in flight cages, i.e., cages sufficiently large for flight

Many of the bats housed in our facility are subjects in studies of the neuroendocrine and metabolic changes that help to support hibernation. Consequently, all of these subjects will be hibernating and inactive, making opportunities for flight both unnecessary and inappropriate (e.g., due to the need for elevated humidity, see below). The number of animals that will be affected by this exception in 2007-08 will be approximately 80.

### 3. Exception to regulation establishing 30-70% as normal range of humidities

As noted above, some of the studies supported by our facility focus on neuroendocrine and metabolic correlates of hibernation. The successful induction and maintenance of hibernation requires the creation of conditions such as bats encounter during the winter in their natural environments. These are characterized by levels of humidity at or near saturation. Despite their departure from the humidities that otherwise might be normal, such elevated levels of humidity are entirely normal for these animals in this condition. The number of animals that will be affected by this exception in 2007-08 will be approximately 80.

ASSURANCE STATEMENTS

- 1) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual research, teaching, testing, surgery, or experimentation were followed by this research facility.
- 2) Each principal investigator has considered alternatives to painful procedures.
- 3) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and approved by the Institutional Animal Care and Use Committee (IACUC). A summary of all the exceptions is attached to this annual report. In addition to identifying the IACUC-approved exceptions, this summary includes a brief explanation of the exceptions, as well as the species and number of animals affected.
- 4) The attending veterinarian for this research facility has appropriate authority to ensure the provision of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.

## **ADDENDUM TO THE ANNUAL REPORT OF RESEARCH FACILITY**

November 30, 2007

#1 Two hundred and fifty-four animals classified in Category D in the 2007 Annual Report were anesthetized for routine dental cleaning required by study.

#2 Assurance statements:

Below is a summary of all such exemptions to the standards and regulations of the Animal Welfare Act.

From October 1, 2006 to September 30, 2007, the following exemptions were approved by Summit Ridge Farms' Institutional and Animal Care and Use Committee:

### Section 3.6 Primary Enclosures

#### (b) Additional requirements for cats

##### (3) Litter

A litter exemption was approved 268 times for adult felines participating on stool quality, digestibility, and urine pH trials. The litter exemption was granted to eliminate the possibility of contamination of specimens in studies involving the collection of feces and/or urine.

### Section 3.9 Feeding

(a) Diets must be uncontaminated, wholesome, palatable, and of sufficient quantity and nutritive value to maintain the normal condition and weight of the animal.

An exemption was approved to allow test diets for gestation/lactation studies and maintenance studies to be fed longer than six months past the milling date. The purpose of these studies is to prove the nutritional adequacy of the test diet on gestation and lactation or maintenance based on AAFCO feeding protocols. The exemption was approved 187 times for canines on gestation, lactation, and growth studies, 48 times for canines on maintenance studies, and 16 times for felines on maintenance studies. This equals 235 times total for canines and 16 times total for felines.

**3. REPORTING FACILITY** ( List all locations where animals were housed or used in actual research, testing, or experimentation, or held for these purposes. Attach additional sheets if necessary )

FACILITY LOCATIONS ( Sites ) - See Attached Listing

**REPORT OF ANIMALS USED BY OR UNDER CONTROL OF RESEARCH FACILITY ( Attach additional sheets if necessary or use APHIS Form 7023A )**

A. Animals Covered By The Animal Welfare Regulations	B. Number of animal being bred, conditioned, or held for use in teaching, testing, experiments, research, or surgery but not yet used for such purposes.	C. Number of animals upon which teaching, research, experiments, or tests were conducted involving no pain, distress, or use of pain-relieving drugs.	D. Number of animals upon which experiments, teaching, research, surgery, or tests were conducted involving accompanying pain or distress to the animals an for which appropriate anesthetic, analgesic, or tranquilizing drugs were used.	E. Number of animals upon which teaching, experiments, research, surgery or tests were conducted involving accompanying pain or distress to the animals and for wh the use of appropriate anesthetic, analgesic, or tranquiliz drugs would have adversely affected the procedures, res or interpretation of the teaching, research, experiments, surgery, or tests. ( An explanation of the procedures producing pain or distress in these animals and the reasr such drugs were not used must be attached to this report	F. TOTAL NUMBER OF ANIMALS ( COLUMNS C + D + E )	
4. Dogs	0	0			0	
5. Cats	0	0			0	
6. Guinea Pigs	0	0			0	
7. Hamsters	0	0			0	
8. Rabbits	0	1			0	
9. Non-human Primates	0	0			0	
10. Sheep	0	0			0	
11. Pigs	0	0			0	
12. Other Farm Animals	0	0			0	
13. Other Animals						
Beaver	0	2			0	2

**ASSURANCE STATEMENTS**

- 1) Professionally acceptable standards governing the care, treatment, and use of animals, including appropriate use of anesthetic, analgesic, and tranquilizing drugs, prior to, during, and following actual rese teaching, testing, surgery, or experimentation were followed by this research facility.
- 2) Each principal investigator has considered alternatives to painful procedures.
- 3) This facility is adhering to the standards and regulations under the Act, and it has required that exceptions to the standards and regulations be specified and explained by the principal investigator and ap Institutional Animal Care and Use Committee (IACUC). **A summary of all such exceptions is attached to this annual report.** In addition to identifying the IACUC-approved exceptions, this summary inc brief explanation of the exceptions, as well as the species and number of animals affected.
- 4) The attending veterinarian for this research facility has appropriate authority to ensure the provision of adequate veterinary care and to oversee the adequacy of other aspects of animal care and use.
