2020 Vesicular Stomatitis Virus (VSV) Situation Report – November 13, 2020

Information current as of 8:00 am MST, 11/13/2020

Since the last situation report (10/29/2020), there have been no new VSV-positive premises identified and there are no active quarantines remaining on previously VSV-affected premises in the U.S. since October 15, 2020. This is the final situation report issued for the 2020 VSV outbreak.

VSV-affected states during the 2020 outbreak included Arizona, Arkansas, Kansas, Missouri, Nebraska, New Mexico, Oklahoma, and Texas.

Classification of Cases

Premises that had laboratory diagnostic results meeting the VSV confirmed case definition were categorized as confirmed positive premises. Once a county was confirmed as VSV-positive, new equine premises presenting with clinical signs of VSV in that county were not required to be tested for confirmation of the disease, but the premises was quarantined and classified as a suspect premises. Premises may also have been classified as suspect if clinical animals on the premises failed to meet confirmed case definition, but there was diagnostic evidence of recent VSV infection.

Quarantines

Confirmed positive and suspect premises were quarantined for at least 14 days from the onset of lesions in the last affected animal on the premises.

Summary of the Outbreak

The 2020 VSV outbreak began on April 13, 2020, when the National Veterinary Services Laboratories (NVSL) in Ames, Iowa confirmed the first VSV-positive premises in Dona Ana County, New Mexico. Arizona, Texas, Kansas, Nebraska, Oklahoma, Missouri, and Arkansas subsequently broke with VSV cases which were confirmed by NVSL on April 22, 2020 (Cochise County, Arizona), April 23, 2020 (Starr County, Texas), June 16, 2020 (Butler County, Kansas), June 24, 2020 (Buffalo County, Nebraska), July 7, 2020 (Washington County, Oklahoma), July 13, 2020 (Newton County, Missouri), and July 27, 2020 (Benton County, Arkansas).

Since the start of the outbreak, 326 VSV-affected premises were identified (206 confirmed positive, 120 suspect). Three hundred thirteen (313) of these premises had only equine species clinically affected, 12 premises had clinically affected cattle (McMullen, Starr, and Zapata Counties, Texas; Butler, Cowley, Marion, and Montgomery Counties, Kansas; Cedar and Ozark

Counties, Missouri), and 1 premises had both equine species and cattle clinically affected (Cedar County, Missouri).

Arizona identified 19 affected premises (18 confirmed positive, 1 suspect) in 7 counties (Apache, Cochise, Gila, Maricopa, Pima, Pinal, and Santa Cruz Counties). Arkansas identified 4 affected premises (4 confirmed positive) in 1 county (Benton County). Kansas identified 196 affected premises (101 confirmed positive, 95 suspect) in 26 counties (Allen, Bourbon, Butler, Chase, Cherokee, Coffey, Cowley, Crawford, Elk, Franklin, Greenwood, Harvey, Johnson, Labette, Linn, Lyon, Marion, Miami, Montgomery, Morris, Neosho, Riley, Sedgwick, Sumner, Wilson and Woodson Counties). Missouri identified 54 affected premises (37 confirmed positive, 17 suspect) in 12 counties (Camden, Cedar, Dallas, Douglas, Jasper, Lawrence, McDonald, Newton, Ozark, Phelps, St. Clair, and Texas Counties). Nebraska identified 5 affected premises (5 confirmed positive) in 3 counties (Buffalo, Gage, and Johnson Counties). New Mexico identified 16 affected premises (13 confirmed positive, 3 suspect) in 6 counties (Bernalillo, De Baca, Dona Ana, Eddy, Grant and Sierra Counties). Oklahoma identified 22 affected premises (18 confirmed positive, 4 suspect) in 9 counties (Adair, Cherokee, Craig, Nowata, Osage, Ottawa, Rogers, Tulsa, and Washington Counties). Texas identified 10 affected premises (10 confirmed positive, 0 suspect) in 6 counties (El Paso, Hudspeth, Kerr, McMullen, Starr, and Zapata Counties).

All VSV-quarantined premises have been released in New Mexico (since June 4, 2020), Texas (since June 8, 2020), Arizona (since July 8, 2020), Nebraska (since July 30, 2020), Arkansas (since August 19, 2020), Oklahoma (since August 26, 2020), Kansas (since September 23, 2020), and Missouri (since October 15, 2020).

Table 3. VSV Serotypes Identified During the 2020 Outbreak

Both VSV-Indiana (VSV-IN) and VSV-New Jersey (VSV-NJ) serotypes were identified during the 2020 outbreak. VSV-IN occurred in the U.S. in 2019, while VSV-NJ was last isolated in the U.S. in the 2014-2015 outbreak. Both serotypes are known to circulate in endemic cycles in southern Mexico. The last U.S. outbreak involving both serotypes occurred in 1997-1998.

State	Premises with VSV-IN serotype confirmed	Premises with VSV-NJ serotype confirmed	Premises with VSV serotype unconfirmed*	Total VSV affected premises
ARIZONA	17	0	2	19
ARKANSAS	4	0	0	4
KANSAS	109	0	87	196
MISSOURI	38	0	16	54
NEBRASKA	5	0	0	5
NEW MEXICO	13	0	3	16
OKLAHOMA	20	0	2	22
TEXAS	3	7	0	10
TOTAL	209	7	110	326

^{*}Livestock in the southwestern and Rocky Mountain regions of the U.S. have been exposed to both VSV-NJ and VSV-IN in recent outbreak years. New infection with either serotype in 2020 can cause elevated antibody titers to both serotypes if previously encountered. The current infection serotype on a premises may not be able to be confirmed if elevated antibodies to both

serotypes are present in the animals and antigen detection tests (RT-PCR and virus isolation) are negative. Additionally, VSV serotype will not be known in suspect cases in which diagnostic testing does not occur.
